You may want to try out this site. It is suppose to have alot of Atari
manuals on it:

http://www.atariworld.com/tech_info/manuals.html

Hi !

I know everything about faceVALUE. And I know its (second) author/manager : Holger HERZOG. faceVALUE is now about version 3.2 (beta) and 3.0 (official). It is the greatest GFA development
tool I've ever seen. I use it everytime. If someone is interested in the DEMO-Program of faceVALUE,
just ask me. It demonstrates 90% of his capability.

Mathieu

4683. Re: Outputing samples on a ST

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-11 22:49:05 UTC

Source record: 1302

```
Before you start, you need to disable both the tone and noise
generators for all three channels (in supervisor mode).

move.l #$0700FF00,$ffff8800 ;load $FF into register 7

>sample_rout:
<snip>
> move.l (a0)+,$ffff8800.w ; copy bytes to soundchip
> move.l (a0)+,$ffff8800.w ; copy bytes to soundchip
> move.l (a0)+,$ffff8800.w ; copy bytes to soundchip

<snip>

>; Converted file for TASM: was IBYTES "..." from
>; file <C:\MOD\TRACKERS\PROPLAY.11B\QUARFAST.TAB>
>sample_table:
> DC.B $08, $00, $09, $00, $0A, $00, $00, $00
<snip>

This should be

DC.W $0800, $0000, $0900, $0000, $0A00, $0000

through

DC.W $0800, $0700, $0900, $0700, $0A00, $0700

to load 0 through 7 into registers 8, 9 and 10. You could save
RAM by only storing the amplitude values in the table.

The d/a converter in the sound chip is deliberately nonlinear,
hense the table. It also only outputs positive voltages, with
RC coupling to the amplifier to remove the DC bias.

Is it only available in German language these days? I really would love
to get an update as this tool is _extremly_ useful if you want to write
modern GEM programs fast and easy.

I have written some GEM programs in standard GFA, but with FaceValue you
hardly need to care about how the user interface works at all. It's all
taken care of automatically. And as there is no speed penalty it's fully
usable on a 8 MHz ST as well. The executables tend to grow a little but
compared to pc Visual BASIC they are still almost non existant :-)

printf() will end up making OS calls. If at any stage during your
"printf interrupt" the OS finds itself in non reentrant code then you
are up the preverbial creek paddle-less!

For what it is worth, the only calls that can be made from VBL without
too much bother are LineA ones. In fact if memory serves, you can
stuff C object code into a VBL slot if it's compiled right.

Mind you, this is a moot point. Your monolithik multitasking system is
going to be reentrant isn't it? ;-))

>are there any examples for how to call user defined C-functions from
>interrupts ?

I did have some code for a custom VBL (linea driven) mouse. That, like
a lot of stuff has gone. This one section remains...

```
#define DEF_VARS
#include <sysvars.h>
#include <cpu.h>
#include "misc.h"
```

```
bool
_mi_vbl_slot(newvbl,install)
void (*newvbl)();
bool install;
/*[ bool _mi_vbl_slot(newvbl,install)
void (*newvbl)();
bool install;

Installs or removes a handler from the VBL queue. 'install' should be
true
to install the user handler 'newvbl' which will be installed in the
first
free slot located. true will be returned for success and false for
failure.

When 'install' is false then 'newvbl' is searched for in the VBL
queue and
removed if it located, returning true for success and false for
failure.

The routine saves the VBL semaphore and then disables VBL processing
while it
searches and restores the original state before returning. The
current
processor state is saved and supervisor state obtained if neccessary,
the
previous state being re-instated before returning.

False denotes a full VBL queue for installation and that the handler
has
already been removed for removal.
]*/
{UWORD old_vblsem;
bool old_state =cp_procstate();
int i;
ptr *addr =(install ? NULL : newvbl);

if (!old_state) cp_superstate();
old_vblsem = *SYS_VBLSEM;
for (
i = 0;
i < *SYS_NVBLS;
i += 1
) {

if ((*SYS_VBLQUEUE)[i] == (ulong)addr) {
if (install) (*SYS_VBLQUEUE)[i] = (ulong)newvbl;
else (*SYS_VBLQUEUE)[i] = (ulong)NULL;

*SYS_VBLSEM = old_vblsem;
if (!old_state) cp_userstate();
return true;
}
```

```
}

*SYS_VBLSEM = old_vblsem;
if (!old_state) cp_userstate();
return false;
}

...have to cut it short. Been awake far too long!

================================================
Some more code as used by the _mi_vbl_slot() function...

//cp_procstate()...
#include <osbind.h>
#define DEF_CPU_COMPILE
#include "cpu.h"

bool
_cp_stat()
/*[ bool _cp_stat()

returns true if processor is in supervisor state and false if it is
not. It
does this by issuing Super(1L).

Note cp_????() functions expect the following:

Processor is initially in user state unless otherwise documented.
Processor state is only altered through cp_????() calls.
User / Super stacks changed only by cp_????() calls.
_cp_stk() is not accessed by uninformed user code.
GEMDOS Super() remains as documented.
]*/
{
return (Super(1L)) ? (true) : (false);
}

//cp_superstate()...
#include <osbind.h>
#define DEF_CPU_COMPILE
#include "cpu.h"

void
_cp_sup()
/*[ void _cp_sup()

_cp_sup() tests (through _cp_stat()) to ascertain the current
processor state
and if that state is user then it issues a GEMDOS Super(0L) followed
by a
_cp_stk(,true) to save the old super stack. Where the processor is
already in
super state then no action is performed. After a successful state
shift then
```

```
the new supervisor stack is set equal to the user stack valid on
entry.
]*/
{
if (!_cp_stat()) _cp_stk(Super(0L),true);
}

//cp_userstate()...
#include <osbind.h>
#define DEF_CPU_COMPILE
#include "cpu.h"

void
_cp_usr()
/*[ void _cp_usr()

_cp_usr() first tests the processor state (through _cp_stat()) and if
that
state is supervisor then it obtains the saved super stack from
_cp_stk(,false)
and issues GEMDOS Super() with that value. This has the effect of
setting the
supervisor stack back to its old value, freeing the user stack from
system use
and placing the processor back into user state. Where the processor
state is
already user state then no action is performed.

It is very possible to mess the system up if you mix GEMDOS Super()
calls with
cp_????() calls.
]*/

If it's NULL do nothing, otherwise interrogate it. You should arrange for your program do run after magxboot & in that fashion I see no reason why it shouldn't work. There's a tad more info in a previous thread in this group entitled "Checking MiNT/MagiC version".

Matthias

4689. ATARI 8-bit 256k ICD MIO with SCSI hard drive Item #1221210739

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-17 05:39:33 UTC
From: gmccla1n@swbell.net
Message-ID: <3ab2f7ca.7679277@spamkiller.newsfeeds.com>
Source record: 1307

The ICD Multi I/O board (MIO) is a complex peripheral device which
adds exceptional power to the Atari 800XL or 130XE computer. The MIO
gives the user five additional hardware functions not available
with a stock 8-bit Atari computer. These are: a parallel printer
interface, a serial interface
for printer or MODEM, a printer buffer, a bootable RAMDISK, and
an SCSI/SASI interface for hard disk drives. An optional sixth
function (80
column board) may be added at a later date. This 256k MIO was
used to run an ATARI BBS quite a number of years ago and was working
fine when
it was stored, It includes the MIO base unit,Instruction manual,
software,SCSI hard drive Seagate 1096N and SCSI cable. I couldn't find
the power
supply adapter. This needs an adapter to use on the 130XE.
SHIPPING IN USA ONLY. Payment must be received within 7 days of
auctions ending.
Shipping charge USPS MAIL $10.00. PS:The ICD/FTe Multi I/O (MIO),
all versions, can use both AC and DC supplies. But stick to voltages
of at
least 6.2-7.2 V. **AUCTION ENDS**

Source record: 1309

Hi all,

I'm trying to change the resolution in Falcon using Setscreen and all
the staff :-)
I think it works... but :-/
Do I have to 'update' VDI after that (change somewhere resolution and
colors)?
If not, then why do I have problems using VDI functions (vro_cpyfm for
example)?

And the second question.
Will it work on Milan too? if not, then how should I change the
resolution on Milan? (I have only F030).

Falcon I cannot say.

> And the second question.
> Will it work on Milan too? if not, then how should I change the

If Milan is anything like the Hades clone, changing the resolution
under program control is a really bad idea if at all possible. Someone
with a Milan might be able to be more specific. It would make more sense
to have the program adjust itself to the current resolution, thus
making your prg run on much more hardware, and future clones.

Hello.

I 've read on "The Atari Compendium" and other documents that physical screenaddress must be aligned in boundary.
What is that mean?? or where can i find a document that explains this question?

Also i read that this boundary chages depending the model, 256 for ST and a word boundary for TT. But what about the Falcon??.

D Galvez

If you change resolution, you're on your own.
There's no way the VDI can know what resolution you have set without
you telling it, and there's no official way of doing that.

With the standard VDI, it might be possible to get it to work by
modifying a bunch of LineA variables, since it makes use of those.
It's even possible that such an approach would work with NVDI.

You are not supposed to use the LineA stuff, though, and something like
this will never work with fVDI (which neither reads nor writes the lineA
variables after startup time).

>> If not, then why do I have problems using VDI functions (vro_cpyfm for
>> example)?

Either don't change the resolution or don't use the VDI.

>> And the second question.
>> Will it work on Milan too? if not, then how should I change the

No.

>> resolution on Milan? (I have only F030).
>
>If Milan is anything like the Hades clone, changing the resolution
>under program control is a really bad idea if at all possible. Someone

It most likely isn't possible to change the mode at all, and in any
case you'd have no way of telling it what you wanted.

>with a Milan might be able to be more specific. It would make more sense
>to have the program adjust itself to the current resolution, thus
>making your prg run on much more hardware, and future clones.

That's definitely the way to do it.

I've heard that some people have added new features to the VDI (not
clear on whether this is NVDI or some Milan/Hades specific VDI) to

make it more 'game friendly' (mode setting, back buffers, etc), but I
have not got any details on this.
Naturally, I would like to add this to fVDI too, but it's kind of hard
to standardise things which are done in secret...
If you have any ideas about features you'd like in a VDI, I'm open
to suggestions.

Hmm... :(

OK. But Line-A is made speciall for ST modes (up to 16 colors). So I
can't change the number of colors to 256 or true color??? or am I wrong?

>>> If not, then why do I have problems using VDI functions (vro_cpyfm for

Well, for me the most important thing is: sprite(s).
Yes, I know... ST/F030 has one sprite (mouse sprite), but it's only
```

16x16x2... make a bigger sprite (minimum 32x32 in 16 or even more colours).

4695. Sound question

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-22 08:32:17 UTC
From: Rafa? Kawecki <kawecki@elektryk.ie.pwr.wroc.pl>
Message-ID: <3AB9B891.2000102@elektryk.ie.pwr.wroc.pl>
Source record: 1314

```
Hi again :-))

OK. Another question concerning sound (XBIOS).
I'm trying to make some sound on my F030 for the game using XBIOS.
Everythinh goes fine except one thing ;)
How should I (or can I) change the frequency (using XBIOS calls)?
I'm going to use some non(??) standard frequencies (44100, 22050....).

And what is the best and easiest way to recognize, that a sample is done.
I have, that I should use Timer-A interrupt or monochrome detect
interrupt... but how? I've been trying to make it in many different ways.

Should it goes like this ? :
- Mfpint(13, myfunc)
- setinterrupt(0, 1)
- Jenabint

void myfunc(void)
{
printf("done");
}

Well, I think it was about the time the TT came out that Atari said that
LineA was no longer supported. To some degree it is even on the Falcon,
however, and I'm reasonably sure you'd be able to get the normal VDI
working by tweaking the right variables.
I'm not suggesting that it's a good idea, though.

>> Either don't change the resolution or don't use the VDI.
>
>But what if I have to change the resolution and then use VDI??

Then you're out of luck.

>>> with a Milan might be able to be more specific. It would make more sense

It may not be all that much fun to have a 320x200 game screen in the
middle of a 1600x1200 display, but it sure beats not having any at all. ;-)

>> If you have any ideas about features you'd like in a VDI, I'm open
>> to suggestions.
>
>Well, for me the most important thing is: sprite(s).

Unfortunately, none of the TOS machines have any sprite hardware, and
I'm not aware of any graphics cards that have them either.

>Yes, I know... ST/F030 has one sprite (mouse sprite), but it's only
>16x16x2... make a bigger sprite (minimum 32x32 in 16 or even more colours).

The mouse is not a sprite on the Atari TOS machines. It usually is on graphics cards, though, but even there only one is available and it's likely to be limited to two colours.

Without hardware support, sprites need to be faked in some way, and a VDI function which did that would probably not fit the requirements of all games, anyway.

Rather, I'd suggest something like:
- A specific 'blit to temporary buffer' function, which would keep things in local RAM on a graphics card.
- The reverse of the above, obviously.
- Masked blit (like on the Amiga), which would do the masking step at the same time as the actual blit.
These three together provide the same functionality as a sprite (well, obviously there's no collision detection or anything like that).
(It would probably be better to generalize the first two with some kind of card memory allocation function.)

Hmm... I was trying to correct some variables but under NVDI ;)
I'll try without NVDI...

What type of interface does it have -- GEM, custom? A debugger that can work under multiple resolutions would be ideal, it's one thing I dislike about the Devpac debugger. So yes, please adapt it for other rez.

Look forward to trying it out.

Later,
Karlos.

4701. question about Falcon HW registers

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-23 11:45:44 UTC
From: Petr Stehlik <pstehlik@sophics.cz>
Message-ID: <3ABB3768.B11E824B@sophics.cz>
Source record: 1324

Hi,

for those that don't read MiNT mailing list:

I need to know everything about HW registers $FF8006 and $FF8007
(Compendium is very wrong on these). Also, I would like to know how the
IDE interface HW regs are used (in which order they are programmed, how
to
construct logical sector number from the parameters etc). Also some IDE
registers TOS 4.04 uses are marked as N/A in Compendium so I would need
better doc on these as well.

BTW, doesn't someone have some routines that would emulate either
blitter
(except sources of STonX which I have but are a bit cryptic) or directly
the LineA routines in TOS 4.04? I would love to get rid of Blitter once
and for all...

Last but not least: how to enable memory test during boot (the line
right
below Atari Fuji logo) - I disabled it 7 years ago and I cannot find out
how to enable it :-)

I have some cool ideas but I need more informations. Hopefully you'll
help
me. Thanks.

Petr

> screenaddress must be aligned in boundary.
> What is that mean?? or where can i find a document that explains this
> question?

It means: the (physical) screen memory always starts at an adress that is a
multiple of the boundary.

On the STe and Falcon this is a word boundary (the screen adres is a
multiple of 2). This because the video hardware of those machines accesses
the memory at a word at a time.
On the TT it is a multiple of eight for the same reasone: the video hardware
of the TT works with 64 bits ate a time.
On the ST the videobase has to be a multiple of 256. This is because the is
no register to specify the least significant byte of the adress.

Hope this helpes a bit.

Hans

There is a little software : Windows Floppy Disk Copy v0.09b
http://musique.atari.org/atari/emul/others.htm

It'll be transform the ATARI disk in a disk image "*.st" than you can use
with any ATARI emulator : http://musique.atari.org/atari/emul/index.htm

4709. GFA and memory

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-27 14:47:49 UTC
From: Rosco <ckrosco@s33d.n3t.tw>
Message-ID: <99q98oud1@news.seed.net.tw>
Source record: 1327

I'm using GFA Basic for a utility that will read all the files in a directory, modify, then save the new data with a new file name. I'm using FSFIRST and FSNEXT to read the directory. I then OPEN "I", #1... to read 1 file and OPEN "O", #2 ... to write the new file. Both files are CLOSEd (CLOSE #1 CLOSE #2) before going on to the next file.

This works fine except that I run out of memory for large directories. I can get around this by reserving a huge chunk of memory when compiling (2 megs), but why should this happen? How can I get OPEN #1 and OPEN #2 to use the same memory block each pass?

If you are doing alot of manipulation with strings, gfa has an
annoying problem where it will eat up all it's string space
over time. This might be the problem you are having.

> This works fine except that I run out of memory for large directories.
> I can get around this by reserving a huge chunk of memory when

> #1 and OPEN #2 to use the same memory block each pass?

Put this somewhere in the loop or before each file pass:
VOID FRE(0)
or
~FRE(0)
depending on your version of gfa-basic.

The zero parameter is important, it forces an internal garbage
collection of all unused string space and should in a sense free it.
Just FRE() with no parameter will return the free space without
causing a garabge collection.

Hope this helps...

I tried this out and no files were written. The program stopped the
first time it came to ~FRE(0).

I guess a workaround is to calculate the available memory and then
notify the user how many files can be processed at one time.

The right answer is to set the boot delay to 32. It has the side effect
of enabling the RAM test.

That is very strange, it should not stop the program.
I have no idea how you are using memory, or allocating it,
or buffering data. Hard to say what is going on, but ~FRE(0)
does not stop my programs on my system.

I shouldn't say stop the program, but it behaved as though it ran out
of memory immediately.

The program was starting with a RESERVE -(whatever) command. I also
tried MALLOC and the corresponding GEMDOS command.

They work fine in the interpreter but the compiled programs seem to
require $m(whatever). If I leave this out the compiled program
crashes with 2 bombs.

As a workaround I'm using $m(40000000) - to make sure I grab all the
memory, and then testing for available memory using FRE(0) and then
advising the user how many files he can process with that amount of
memory. This is acceptable, I think.

Hi Rafal!

RK>What can it be: "Out of internal memory. Use Folder100.prg" ???
RK>Folder100.prg is installed.
Rename it to Folder200.prg (or whatever number you want/need). The number in the filename is used as a parameter

RK>14MB of RAM and about 9 MB is still free.
Internal memory is allocated statically and to enlarge it's amount you have to use Folderxxx.prg

If I recall correctly if you are using the folderXXX.prg there
is another patch that is common to use along with this called
cacheXXX.prg. Both patch different parts of the OS.
I do not have this patch, as HD Driver (fine product btw)
has these things built into it.

That still sounds strange to me, I use the ~fre(0) all the time.

> The program was starting with a RESERVE -(whatever) command. I also
> tried MALLOC and the corresponding GEMDOS command.

It's common knowledge that the reserve command should be avoided
in compiled apps. It might be ok for testing in the editor, but I never
use this command myself.

> They work fine in the interpreter but the compiled programs seem to
> require $m(whatever). If I leave this out the compiled program
> crashes with 2 bombs.

Without the compiler command $mXX your compiled app will take
all available ram, thus there won't be any ram left in the
system to allow calls to malloc().

$mXX tells the compiled app how much ram to keep, and gives the
rest back to the system.

> As a workaround I'm using $m(40000000) - to make sure I grab all the
> memory, and then testing for available memory using FRE(0) and then
> advising the user how many files he can process with that amount of

From my own projects, I've found the best method to be:
1) Don't use reserve (only use this in editor for testing)
2) Always use $mXX (especially important under multi-tasking)
3) Use malloc() to get ram as needed and mfree() to free it
4) Use ~FRE(0) to clean up the string area regularly

Perhaps someone else into GFA wishes to add to this?
I use my own advise in AtarIRC, it seems to work ok for me. ;-)

I'll try it again with your suggestions.

Sometimes weird things happen with GFA...on this same project I had two versions of the same program - THIS.GFA and THAT.GFA. I incorporated a progress bar into THAT.GFA and it worked fine, so I included the same code into THIS.GFA - absolutely no go. I printed out the code and checked minutely...they were exactly the same, but one worked and the other one exited as soon as it got to the progress bar. I rebooted, ran one program first and the other second, another reboot, running the reverse order, the second program just didn't work. I finally pasted the code from one to the other procedure by procedure, eliminating the old procedures, and got it to work.

> These three together provide the same functionality as a sprite (well,
> obviously there's no collision detection or anything like that).
> (It would probably be better to generalize the first two with some kind
> of card memory allocation function.)

The above would be really nice, what about some 3D object, z-buffering, etc which is also built into many of the modern cards (don't know if cards like Eclipse or Galaxy do though).

With the original problem in mind, could there not be some kind of "fullscreen" call which would allow you to request a resolution based on W x H x D (maybe pages) that were passed, with an error returned if the computer was not capable?

This is all getting along the lines of (dare I say it) DirectX kind of stuff, but I am sure the implementation would be far batter.

Mark.

The RageII supplied with the Eclipse does have 3D support. It was one of
the first mainstream cards with that, though, so it is of course lightyears
from today's cards.
Unfortunately, I don't have any documentation for those parts. It might
be possible to dig out something from various Linux graphics driver code,
but I'm not promising anything.
It's more likely that I'll put some effort into these kinds of things for
3DFX Banshee/Voodoo3/4/5 or S3 Virge since I do have what appears to be
complete documentation for those. So far I only have the beginnings of
the 2D driver for the Banshee, though.
(I have at least a dozen different PCI video cards in a pile here.)

The Galaxy uses a (reasonably large) FPGA (Field Programmable Gate Array),
so it could certainly be made to do 3D if someone put their mind to it.
To my knowledge, there's nothing like that now, though.

>With the original problem in mind, could there not be some kind of
>"fullscreen" call which would allow you to request a resolution based on W x

Certainly. It's easy enough to do in the fVDI/RageII driver.

>This is all getting along the lines of (dare I say it) DirectX kind of
>stuff, but I am sure the implementation would be far batter.

Without breaking with the entire VDI API (horrible low level interface
and very limiting, IMHO), that is not likely.

99% or so of the DirectX functionality would in any case be completely
out of the question for performance and effort reasons.

Lonny

I've been trying out your suggestions - use $mxx, use malloc() and mfree(), use ~fre(0) to clean up string area.

It doesn't seem to work with FSFIRST and FSNEXT for reading a directory. On the first occurance of ~FRE(0) the program exits as though reaching the last file in the directory.

I made a copy of an article to get directories using something like
FSFIRST and FSNEXT, but haven't gotten around to chaing my GFA basic progs
that use the old 'write to disk then load' method. I can pursue it.

Are you reserving the string space outside the load/modify/write
routines? And making sure to reset the pointer to the start of the
string(cnt=1) ?

If you are accessing a hard drive or cdrom drive with lots of folders, then even 100 may not be enough. Most ST Oses have a patch to fix the problem with "not flushing the folder buffer when the window is closed and another partition is read".

Have you tried changing it from 100 to 250? Also, make sure you have the right prog for the computer you are using.(ST/TT/Falcon frequently use different versions). And it may have gotten corrupted.

And finally, the error isn't necessarily with the folder program, its just the first one that could print out an error message. See whats in the boot chain that follows it in the auto folder.

Now that you mention it...I don't think the string space was
reserved...

I'll try that out and report back. Thanks.

That is very strange. Is this project something you wish not
to allow ppl to see? I have never had a problem with ~FRE(0)
and would like to see what is going on with it on your end if that
is possible. If not I can understand. ;-)

I use ~FRE(0) in my IRC program without any problems, and it runs
on ST's, Falcons, and up, even on my Hades060 it's fine.

I wanted to add, just using ~FRE(0) is not some cure all, especially
if you have some other command somewhere eating up gfa's internal
memory area. Like using temporary numeric arrays and forget to
free them and the like. Also if you don't mind me looking over the
code, I was suggesting you send it directly to me, not post it on
usenet. ;-)

> To my knowledge, there's nothing like that now, though.

Again this looks like hardwork, unless someone really wnats to do this then
I think the effort would be better spend on another project.

I would like to see this, there should be no reason why simple games could
not be developed and run nicely on a number of systems. As mentioned,
blitting abilities would be nice.

> 99% or so of the DirectX functionality would in any case be completely
> out of the question for performance and effort reasons.

I thought that 99% of Direct X was pointless loops or NOPs, I imagine so
they can remove a few and make it a bit quicker on the next release.

Seriously, the major functions like paging, blitting, sprites, fonts, music
(I know that's not you), etc would be nice. The chap that made the Doom
ports wanted to start some kind of project along these lines.

Mark.

> memory. This is acceptable, I think.

I don't think so, if it is a useful app which you want to release in the future you do not want this coming back to haunt you.

As I understand you only need to open one file at a time, make the changes, write it back (is this right?), so you should be able to reduce the limitations by saying "the single biggest file" rather than "the sum of the file sizes" which should greatly improve usability of the app.

Better still, if the editing procedure permits it you could read chunks of data in at a time (64K or so) and then save it as you go, your program would then be reduced to using a static (say) 180K of RAM rather than 140K to 140Mb.

If only two files need to be opened at once I would seriously consider changing you loop procedure.

I may be way off but I hope this helps.

Mark.

Hi all,

ACSpro (http://acspro.atari.org) stands for "Application
Construction Set professional".

It's a, visual, user-friendly, application construction
set, coming from Germany (English version is available). It
works on all Atari systems, including clones and emulators.
Supported languages are GCC, Pure C, Lattice C, Turbo C and
Pure Pascal. Lots of examples are supplied as well as
libraries for Pure C and Pure Pascal.

It's now possible to register your copy via
Europe Shareware (http://www.europe-shareware.org).

Bye,
P. Ricard (ES)

4736. GFA and STinG programming: ICMP_xx ?

Newsgroup: comp.sys.atari.programmer
Date: 2001-04-13 19:47:58 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3ad7658a936f650@tripnet.se>
Source record: 1255

I'm trying to send Ping messages with STinG using GFA Basic.

Starting from the STIK_GFA library by Lonny Pursell so far it seems to work well with STinG as well. I had to delete some STiK specific "declarations" but apart from that it seems quite usable.

Now I'm trying to port the ICMP_SEND part (quoting the STinG .HYP):

```
----------
int16 cdecl ICMP_send (uint32 dest_host, uint8 type, uint8 code,
void *data, uint16 length);

Function :
Send off ICMP datagrams.

This function sends an ICMP message. `dest_host' is the IP address of the
destination machine, `type' is the ICMP packet type. `code' is a type de-
pendent control code for ICMP. `data' is a pointer to data which is to be
send after the ICMP header, `length' is the length of the data block in
bytes.
----------
```

by writing:

```
FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
type.&=OR(SHL&(type.&,8),code.&)
RETURN C:icmp_send_%(L:rhost.%,W:type.&,L:buf.%,W:len.&)
ENDFUNC
```

What about the second line. Should it perhaps be written the other way around like:

```
type.&=OR(SHL&(code.&,8),type.&)
```

to get the two byte parameters right on the stack?

Next step will be how to implement the ICMP listening part. The STinG doc's talks about "callbacks". Does this mean (to GFA) that I have to provide an address to an INLINE code part and then read the resulting queue from Basic?

```

I'm glad you found my gfa devkit useful.

> int16 cdecl ICMP_send (uint32 dest_host, uint8 type, uint8 code,

I assume uint8 is an unsinged 8bit value. "C" is not my strong
point.

> ENDFUNC

This would be my guess. If you had some way to test it that
might shed some light on it. I see your problem, GFA can't pass
a byte directly with the C:() function.

> Next step will be how to implement the ICMP listening part. The STinG

I'm not sure what you mean by callbacks. If you are refering
to some way to make external calls to GFA code from some outside
source, then you have a problem. There is only one way I know of to do
this and you can find it in my GFA archives on my web site, called
EXTCALL.LZH. However it has limited use and requires some polling
method, you might also need to know assembler to adjust the routine
to you needs.

I'm confused why you use $m to keep such a large memory area for
gfa's internal string/memory area, and then malloc() another block
from the system nearly identical in size. I don't know how
much ram you have, but the malloc() "gamdos72" call might
be failing?

You really should test this value to see if the malloc() is ok:

```
IF mem_addr%<=0
PRINT "malloc() error!"
END
ENDIF
```

The rest of code is not too helpful since it is incomplete.
Some small bit you think is not worthy of posting could be where
the problem is. ;-)

From what I can tell you are simply processing many files, rather
small ones at that. Something really strange is going on if you run out
of ram. I'm not sure what it is after looking at your code.

4739. Re: GFA and memory

Newsgroup: comp.sys.atari.programmer
Date: 2001-04-15 04:50:12 UTC
From: Rosco <ckrosco@s33d.n3t.tw>
Message-ID: <9bb9ed$9lk$1@news.seed.net.tw>
Source record: 1258

You're right - I want to process hundreds of files about 4000 bytes each. The procedure is to use FSFIRST/FSNEXT to read a directory, get the name and size of the file from the DTA, OPEN that file to read, OPEN a new file to write to, trim off about 6 bytes from the original file and and save this data in the new file, then CLOSE both files.

If I allocate (say) 100,000 bytes with $m100000, the program will quit after about 70 or 80 files.

My workaround solution is to grab all available memory with $m40000000 and then calculate the actual amount of ram available to advise the user how many files he can process. I know that's redundant, but it doesn't cause problems.

What I would ideally like to do is to use the SAME memory block for each OPEN / CLOSE cycle. But if I insert ~FRE(0) anywhere in the program it exits immediately as though it has come to the last file in the directory.

I suspect I need to assign a memory block of about 5000 bytes to read the file data into, but I don't know how to do that.

If you know the maximum memory you need, why not use INLINE to allocate
it and then use BGET/BPUT, or even BLOAD/BSAVE, to load and save the
files.

EG:

PROCEDURE process.files(input.name$,output.name$)
' use a 6k buffer
INLINE our_buffer%,6144
'
OPEN "I",#81,input.name$
OPEN "O",#82,output.name$
the.size%=LOF(#81)
'
' Read the file into the buffer, upto a maximum of 6k
'
BGET #81,our_buffer%,MIN(6144,the.size%)
'
' Write out the buffer, skipping the required 6 bytes
' this assumes the first 6 bytes are supposed to be skipped
```

```
'
BPUT #82,our_biffer%+6,MIN(6144,the.size%)-6
'
' Check if the file is bigger than 6k, and copy the rest if it is.
'
SUB the.size%,MIN(6144,the.size%)
WHILE the.size%
BGET #81,our_buffer%,MIN(6144,the.size%)
BPUT #82,our_biffer%,MIN(6144,the.size%)
SUB the.size%,6144
WEND
CLOSE #82
CLOSE #81
RETURN
```

Regards,
David Bolt

I don't think beyond the original stik devkit I was too helpful.
I've switched to mintnet some time ago and not used sting calls
at all, or stik2 calls either. ;-)

The EXTCALL does something similiar, it lets you pass out the address
of the inline to some other app. The app can then call this routine
and pass parameters which are stored. I don't know if this will work for
you purpose. Unless you code your own method, this EXTCALL is the
only one I know of that works with GFA.

> OPEN a new file to write to, trim off about 6 bytes from the original
> file and and save this data in the new file, then CLOSE both files.

Would be as simple as:

```
' load file to be converted
OPEN "I",#1,in$
fl%=LOF(#1)
ba%=MALLOC(fl%)
IF ba%<=0
' error has occured
ELSE
BGET #1,ba%,fl%
ENDIF
CLOSE #1
' code to convert file would be here
OPEN "O",#2,out$
BPUT #2,ba%,fl%-6 !trim off the end
' BPUT #2,ba%+6,fl%-6 !trim of the beginning
CLOSE #2
~MFREE(ba%)
```

This will do alot of allocation/deallocation cycles. But I show
you this so you can see how easy it is. A better way would be to
know the largest file you intend to load, and MALLOC() the buffer
just once and reuse it, then free it when the program is to end.

You could use inline also, as long as the buffer is under 32k and
you don't care how large the binary gets when you compile it.

The ~fre(0) is only useful if you are doing massive string
manipulations, I'm still baffled why it halts your program,
but it may be related to your memory problems.

Thanks for replying Lonny Purcell! (My newsserver has been down so I had
to catch your reply from Google). Your code has been of great help.
Worked almost without any changes. Unfortunately my code will not work
with STiK _or_ STiK2 as the interfaces works differently.

>I'm trying to send Ping messages with STinG using GFA Basic.

"original" C code:

```
>int16 cdecl ICMP_send (uint32 dest_host, uint8 type, uint8 code,
>void *data, uint16 length);
```

```
>FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
>type.&=OR(SHL&(type.&,8),code.&)
>RETURN C:icmp_send_%(L:rhost.%,W:type.&,L:buf.%,W:len.&)
>ENDFUNC
```

The above code did not work, but provided with a bus error from STinG.
After som experiments I came up with:

```
FUNCTION icmp_send(rhost.%,type.&,code.&,buf.%,len.&)
$F%
type.&=SHL(type.&,8)
code.&=SHL(code.&,8)
RETURN C:icmp_send_%(L:rhost.%,W:type.&,W:code.&,L:buf.%,W:len.&)
ENDFUNC
```

that does work! Perhaps a bit surprisingly I had to shift left 8 bits and
then feed the stack with words. Anyway Logsting (a development tool for
STinG) showed up with:

```
Call to 'ICMP_send' ($444c353).
Remote_Host (IP) : 192.168.0.2
ICMP_Type (uint8) : 8 ($8)
ICMP_Code (uint8) : 0 ($0)
Buffer_Address (uint32) : 3731794 ($38f152)
Buffer_Length (uint16) : 32 ($20)
$0000 : 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 '
$0010 : 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 20 '
returns (int16) : 0
```

and ZoneAlarm on my pc popped up with a warning about "Ping" from
19.168.0.194 so everything seems OK now.

My next attempt will be to recieve the answer. The "callback" from STinG
should mean that I first provide the STinG kernel with an address within

my program with code to act on the call. When an "Echo reply" packet
arrives STinG jumps to the address and my code gets runned.

This has to be a short INLINE assembler routine that somehow buffer the
incoming data so the GFA program can fetch it later on. I have not yet
figured out the data structures in detail but eventually i will...

Yes, this EXTCALL routines works pretty much the same (some work saved again!). I have to elaborate the idea somewhat with internal checking if the recieved packet originated from me etc. I also must send a ICMP_discard message back to STinG within this INLINE routine.

I'm writing a GEM program and the idea of "piping" messages from the routine seems appealing. Makes me wonder if it's possible to do an APPL_WRITE call to GEM when in supervisor mode during an interupt?

What I'm writing? A connection monitoring program to be runned on my online TT. Sometimes my ADSL line goes down and it would be nice to get a warning when that happens. Could also be fun to monitor some other servers and get graphs etc on screen. But, first I have to get this Pings to work...

Source record: 1268

I was just about to release the new version of ELFBACK when I
discovered a very annoying result. Both the ST and TT versions
of the program work fine, but they produce incompatible backups!

About the only difference between the versions has to do with
calculations of the form A*B/C using unsigned longs.
On the TT I use 64 bit multiplies and divides, but on the ST I
have to use

A*B/C = (A/C)*B + (A%C)*(B/C) + (A%C)*(B%C)/C

The only other differences have to do with compiler options.
Very annoying!

The OS does not contain any floating-point code (I should know, I have the
source ;-)).

The old ST basic was quite buggy not only in regards of floating-point -
that was why noone is using it anymore, since better alternatives exist -
GFA-Basic, PureC and other development systems have working float support.

Source record: 1272

Thank you Lonny and David for your advice on how to use the memory...

Things are now working a lot better but I still have a problem that is driving my buggy....

I give a choice at the opening - one choice will trim the file down and the other choice will add 8 bytes to the file (6 at the beginning and 2 at the end.)

The section that trims the file works beautifully - I can use ~FRE(0) and I don't run out of memory. I use:

```
BPUT #2,work_buffer%,4096
```

The section that adds bytes processes two files before exiting - if I use ~FRE(0). If I don't use ~FRE(0) all the files will be processed (in the interpreter), but the compiled program will run out of memory and only process a few files (unless I allocate a lot of memory using $m1000000).

The section goes like this:

```
OUT #2,&HF0,&H43,&H0,&H9,&H20,&H0
BPUT #2,work_buffer%,4096
OUT #2,&H29,&HF7
```

Why is this causing a problem with ~FRE(0)? Everything else in the program is identical.

```

Uhm. Considering the normal quality of the TOS code, I'd say the answer
to that question is a resounding NO. ;-)

>much simpler and faster had TOS author(s) made a library of floating-point

Not many things use floating point in the first place (well, at least
not many _need_ floating point), and since most people don't write in
assembly, it doesn't matter where the float code is.
It definitely wouldn't have been faster to have something locked into ROM.

>operations and functions a part of the OS. It could have made the best of
>various configurations of CPUs and FPUs and take just a little ROM space...

You can't make good use of an FPU via a library.
The calling overhead is a major hit even on an '030. With an '040/'060
it would swamp the actual execution time of common operations.

From: elfsoft@mindspring.com
Message-ID: <9bv798ceq1@slb0.atl.mindspring.net>
Source record: 1280

I've been playing around with a concept you might find useful.
It's a way to implement a multi-threaded GEM interface using
independent threads for each window, plus one for the menu bar.

Each thread uses a diffent stack and, except for global variables
and a common application id, each thread functions as a separate
program under cooperative multi-tasking. The interface can even handle
multiple timer events with different delays.

I put a demonstration program into my FTP library (DEMO.ZIP) and
a slightly longer explaination under my Projects page.

Whatever, even now, a coprocessor-emulator for TOS based machine would
be cool woudn't it ? And not that hard to write if you consider you just
have to
install your code in line-f ! :)

Not sure about Milan, but I ordered a hades directly
from Medusa last november. No US dealer for hades.

Source record: 1284

Thank you Lonny for the changes. All is working well now.

There was another little glitch in the file renaming code. If the file name had less than 8 characters before the extension (SPACE1A.TX7) the new file would be written as SPACE1~1.SY instead of SPACE1A.SYX.

The original code was :

```
OPEN "o", #2,LEFT$(filename$,8)+".SYX"
```

I changed it to:

```
x=INSTR(filename$,".")
OPEN "o", #2,LEFT$(filename$,x-1)+".SYX"
```

Thanks again for all your help.

BTW I'm using GFA 3.5e

Yes, theoretically it would be cool. And it even exists- Henk Robbers
made it a long time ago and I have the program installed on my computer
(in fact it emulates a line-F coprocessor through a memory-mapped one).
Unfortunately I have yet to come upon an application which uses it-
because sowtware authors are inclined to think that if you have a
coprocessor you must also have a 68020 or better, so they always seem to
compile a coprocessor version, if any, as 32-bit code- which need not
be so.

A nice touch :) I must agree with this.

>Not many things use floating point in the first place (well, at least
>not many _need_ floating point), and since most people don't write in
>assembly, it doesn't matter where the float code is.

>It definitely wouldn't have been faster to have something locked into ROM.

My idea was that it would have made fp operations performed in a unified
way, taking automatically into account a FPU if it exists (so that
separate FPU versions need not be compiled), and it would also take away
different implementations of floating point numbers (IIRC GfaBasic uses
some weird format for floats). I suppose also that it would not be hard to
find examples of badly-coded floating-point functions created by some
compilers, or linked from this library or that, as everybody reinvents
the wheel again- which would be avoided assuming a well-optimized OS library.

As for speed- I admit I was biased by a machine I have- a MC68000 MegaST.
On a MC68000 Atari ROM access could be, quite easily, made to be faster than
RAM access (running CPU on 16MHz for internal ops AND ROM access), but on
any other Atari it was not so.

>You can't make good use of an FPU via a library.
>The calling overhead is a major hit even on an '030. With an '040/'060
>it would swamp the actual execution time of common operations.

I would agree that it might be so for basic arithmetic. What about, say,
trigonometric functions, etc. Do you mean that calling a library for
basic fp arithmetics would kill any advantage in computing more
complex functions?

4768. New: Good old GEMDOS site

Hello, Coders!

After clearing up the license status of Digital Researchs GEMDOS,
I can now provide most parts of GEMDOS under GPL license. They have
been available for a longer time on the GEM World site, but the
copyright status had been unclear. This now changed (as you can read
on my site).
You now can get a GEMDOS porting kit with all, but the machine
specific parts of GEMDOS in source form. Maybe, it is just for
historicle interest, maybe you can use it for something new. So, now
have a look at:

http://www.mucl.de/~mdoering/atari/en/index.htm

At last many thanks to Lineo - they made this possible!

For RedHat and Suse Linux there are ready to install cross compiler
packages (http://wh58-508.st.uni-magdeburg.de/sparemint/cross-mint.html).

With cygwin I'm sure you can compile the cross gcc under Windows too.

Cygwin is a Unix environment for windows.
Look at http://sources.redhat.com/cygwin/ for more informations about
cygwin. Then just get the binutils/gcc and the FreeMiNT patches and build
the crosscompiler :-)

To be compatible with machines without FPUs, the calling interface to
any such functions would have to pass the float variables in the integer
register or on the stack (or similar). Needless to say, that would cause
tremendous overhead for machines that do have FPUs.

>separate FPU versions need not be compiled), and it would also take away

For the few programs that actually benefit from FPUs, I don't think
building two (or more) versions is a major problem.

>different implementations of floating point numbers (IIRC GfaBasic uses
>some weird format for floats). I suppose also that it would not be hard to

Well, full IEEE754 compatibility is a vast overkill for most applications,
but necessary in other.

>find examples of badly-coded floating-point functions created by some
>compilers, or linked from this library or that, as everybody reinvents

And the basic arithmetic functions implemented in hardware in the '040 and
'060 cover the vast majority of floating point operations.

>trigonometric functions, etc. Do you mean that calling a library for

Only the '881/'882 support those functions in hardware, anyway. The '040
and '060 needs partial FPU emulators or libraries in any case (a library
could be significantly faster).

>basic fp arithmetics would kill any advantage in computing more
>complex functions?

Naturally, in most cases, since the complex functions are far less
commonly used.

Doing function calls for addition and multiplication on a modern
processor could easily bring your throughput down from one result per
cycle (I don't think even the '060 manages that, though) to (possibly
significantly) over a dozen cycles per result.
(Apart from the obvious extra time needed for parameter passing and
function calls, you can't make use of the pipelining in the FPU, since
every result needs to be complete before you can move it to the stack
or integer registers.)

It really depends on the GEM library you use. Popup menus are not a standard
feature for TOS<4.x. The manual of your GEM lib should explain how to create
them.

Hi programmers!

Hmm, is there away to set the unused (AFAIK) RTS pin on the midi 6850 ACIA? I need to write a tiny program that once run, turns this pin to a 1 state. I have Lattice C but it doesn't say how to do it so I guess asm is the only way. I looked at he memory registers but all I find is the base address in hexi this device. Actually basic should be able to do this well enough thinking about it.

Anyone know what each bit is for at the control address for midi ACIA?

Thankyou.

There are 4 registers using 2 addresses
2 are read only; received data & status
2 are write only; transmitted data & control
You can't read the control register so you'll need to keep track of it,
use a variable to store the control byte

Bits 6 & 5 control the RTS line

Bit 6 5 RTS function
0 0 low transmit int.disabled
0 1 low transmit int.enabled
1 0 high transmit int.disabled
1 1 low transmit int.enabled

Bits 4,3 & 2 set data bits,parity & stop bits

Bits 1 & 0 set the clock divider

the byte 00000011 is the master reset code

Not sure about bit 7, best to set to 0.

If your using BASIC just use POKE (ACIA address),control value

Hmm, I'm no genius but wouldn't poking a value (without peeking at what
is already there) muck up the parity/data bits information?
Would some apps ever turn this RTS pin to high state? This /is/ a concern
as it would be controling the PSU.

Thanks

The ACIA is not used for the RS232 port, it is used for the MIDI port
The address for the control register is FFFC04 and it is read only.
I don't see any way of insuring that the port isn't accessed by a particular program, I would assume those involved in audio would.
This is only a suggestion and I can't see how you would implement it.
You could use an interrupt driven routine to
i. constantly monitor the pin itself perhaps reading its state via the joystick port or cartidge
ii. if the pin goes low force a reset on the computer, this would at least indicate potential problem programs

I might be wrong but I think the ACIA data goes in on lines D8-D15Y

You could use pin 3 of the video port. This is the general purpose output. It is taken from I/O port A bit 6 of the sound chip. As far as I know you can read the registers on this. I'd have to check my trusty OSI Superboard literature ;-) (this system with a massive 8K BASIC, 2K monitor, AND whopping 8K of RAM) used the same sound chip)

Having re-read the above am I missing something. Is the line going to turn the PSU on or off. If the former you'll have a bit of a problem won't you?

I've gotten a prototype of my spell checking accesory up and running, but have gotten bogged down on the dictionary. I've been using a file I got from A.FASOLDT (I miss Genie!), but it includes a lot of things which don't belong (like abbreviations, acronyms, suffixes, prefixes and proper names). I'm pruning it by hand, but at this rate it may take a few weeks.

BTW, the final version will interface with other programs via the cookie. If you have an editor and are interested, let me know.

It was an idea using an ATX PSU (my Falcon is towered) and a momentry
switch is used to start the PSU and then a wire (that is naturally 0)
would take over. Set this high and the PSU would go off.

I think I may just leave it actually, I just wanted it o be fancy! Unless
I use the extended joystick port, as there was a long tutorial about it in
AC.

Thanks anyway!

Hi, Lindon

Look into the Lacescan package. In that, you will find a couple of small programs (including source) for setting and resetting RTS of the keyboard ACIA. Just change the KBD ACIA address to that of the MIDI ACIA and all should be well.

Otherways, you can just poke the appropriate address and insert a proper value. I tried this from GfaBasic (to set/reset Lacescan) and it worked, of course- but it has to be done in supervisor mode. Basically, for KBD ACIA, you poke $D6 and $96 to set RTS on/off (or vice-versa?) into address $FFFC00. For MIDI ACIA it should be $FFFC04

>Anyone know what each bit is for at the control address for midi ACIA?

Look on Atari ftp sites for a file named, strangely enough, HARDWARE.ZIP. In that, there is a complete memory map for a range of Atari computers. Below is a segment that should interest you. Again, compare with Lacescan documentation:

```
-------+-----+-----------------------------------------------------+----------

Thanks, I was using the memory map from Mark Baines A to Z and it only
said the address. I had soo many pieces of text but I delted them all off
the ST when I moved it's HD to the Falcon. I had this file from funet I
think.

Thanks (I think the lacescan stuff was on AC cover disk back in issue 5 or
somewhere)

I think I might attempt this project actually.

Hello,

MagiC SDK

Europe Shareware is now able to offer a complete software development
kit for MagiC to all the programmers. This package includes:

ï¿½ either MagiC Atari or MagiC Mac or MagiC PC, with paper manual
ï¿½ The GCC kit
ï¿½ GCC Shell, registered version
ï¿½ Ressource Master, registered version, with paper manual
ï¿½ Windom libraries with its printed documentation (200 pages)
ï¿½ EZ Edit text editor (with syntax "colourisation")
ï¿½ Many development libraries
ï¿½ Many development tools

All this for only 75.00 Euros !

This offer is for developers only. To have the advantage of this offer,
you must tell us which MagiC compatible programme you have made in the
past 24 months or which one you are going to produce in the next 12
months.

Have a look at the MagiC SDK page:
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Bye,
P. Ricard (ES)

Actaully you should just be able to read the MIDI on an Atari by using any Atari MIDI software. I have alot of MIDI files that I have gotten of a PC program and they work fine on my Atari setup. The problem comes when you try to use a MIDI Mac file. There is a program that I have that takes off the header of the file and makes it so a PC/Atari can read it.

Hi Andrew,

I forgot what the url is but try usine a search engine to find Mario Becrofts site. He has some hardware upgrades for ST's and one has an IDE host adapter so you might be able to use that to get the drive working on the ST. if you email to bestelec@concentric.net thats a place that sells replacement parts for the ST so you could probly find a new mouse from there.

> You can set and clear bits at specific addresses using C...*no*
problem.

There doesn't appear to be a _clean_ way of doing what you want to.(ie
read old hardware value, store it somehwere, modify the read value,
write it to the hardware, do something, restore hardware to saved
value) as the data read from the ACIA is in a different format to what
is written to the ACIA.

Unfortunately, setting or clearing bits within a memory address , when
using Lattice, often involves a Read/Modify/Write code sequence, where
the code generated by Lattice will fetch the old value, modify it, and
then write it. Given the value read from the register is in a
different format, and has a different meaning to what is written, you
cannot use a "modify bits within a byte" coding style
ie: "a = (b & ~c) | d".is not feasible

So it looks like you'll have to simply reprogram the whole ACIA
register, instead of just the RTS portion of the ACIA register.

A sample app in C would look like this:

```
#include <osbind.h>

char value = ????; // default value for ACIA register

int set_midi_acia( void )
{
// write value to byte register at 0xFFC04 and return value
written
return *(char *)0xFFFC04 = value;
}
```

```
int main( void )
{
value = whatever; // value to configure ACIA
Supexec( set_midi_acia ); // do the configuration

do_something(); // do something

value = whatever; // set it to a default "safe" value
Supexec( set_midi_acia ); // reconfigure the ACIA

return 0; // return success code
}
```

I've recently had a phrase come to mind, and I cannot seem to recall where I first saw it.

The phrase is "OPTION BASE"

I seem to recall it being related to assembly language, but I cannot find it within the Devpac 3 manual, or within the Lattice C assembler docs.

Has anyone else come across this phrase? If so, where? And what does it mean?

In GFA-Basic there is a command called OPTION BASE to set the starting
index of arrays. OPTION BASE 0 or OPTION BASE 1 so if you would
wish to you can exclude index 0.

Was that it?

By a strange coincidence I was just looking at your GEMDOS
site before wandering over here to ask about cross-compiling
software for TOS or MiNT.

I'll have to see whether cross-gcc is available for NetBSD,
although I could probably get the Linux version working with
a little effort (installing Linux compatibility). Would I
need any special libraries or other files to compile code
for TOS or MiNT on a (Linux or NetBSD) PC?

Regards,
- Andy.

It has to do with arrays. With option base 1 your arrays start with
element No 1. Option base 0 makes the elements start from No 0.

Hello!

> I'll have to see whether cross-gcc is available for NetBSD,
> although I could probably get the Linux version working with
> a little effort (installing Linux compatibility).

You can simply recompile it under NetBSD. I mainly use the crosscompiler
under NetBSD. The linux rpms I built for easy use by other people.

> Would I need any special libraries or other files to compile code
> for TOS or MiNT on a (Linux or NetBSD) PC?

You only need the libs you also need if you compile nativly. The rpms
contain the basic libs (libc, gemlib).

4809. New DLL manager for Atari

Newsgroup: comp.sys.atari.programmer
Date: 2001-06-01 10:58:17 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <9f7sj9$74q$1@news.comnet.co.nz>
Source record: 1228

My Toolbox DLL manager is now available for download.

Simply go to http://www.atari.net.nz/gem and follow the links from there.

The archive contains the AUTO folder TSR, a user manual, programmer manual, and an example client app which calls/loads a simple library (both complete with C source code).

A library enumerator accessory, and library configuration CPX are also included.

Can someone tell me how gfa-basic represents an 8 byte floating
point value?

For example if I do:
f=22
open "o",#1,"test.dat"
bput #1,v:f,8
close #1

If I gave this file to someone who uses 'C' for example they
need to know how gfa internal stores these in order to read back
the value correctly.

I've been going over my Toolbox DLL manager (available from my web page [http://www.atari.net.nz/gem/tlbx] and I'm currently wondering what features I should add/modify.

At present, I'm thinking of adding some form of "call logging" so a programmer can look at the last few calls to the Toolbox or its dynamically loaded libraries, and detect what happened while their program uses the Toolbox.

Are there any other features I should be thinking of adding?

4817. Falcon hardware register

Newsgroup: comp.sys.atari.programmer
Date: 2001-06-17 07:44:08 UTC
From: Philipp Donzé <PhilippDonze@gmx.ch>
Message-ID: <3B2C5FC7.F8EF9811@gmx.ch>
Source record: 1234

Does anybody know anything about the meaning of the falcon hardware
registers $FFFF8000/$ FFFF8001 and $FFFF8006.

The only thing I know is that the content tells something about the
memory installed. (TOS 4.04 uses this information to initialy clear
the memory)

Every documentation I found says something about the screen type
(TV, VGA, B/W,...).

Here what I know now:
$FFFF8600 7654xx1x
|||| |
|||| +---- Memory configuration Bit 0 (found by my self)
|||+------- Memory configuration Bit 1 (found by my self)
||+-------- Memory configuration Bit 2 (found by my self)
|| These bits inform you how much memory is installed:
|| 001 = 1 MB installed (= 512KB * 2^1)
|| 011 = 4 MB installed (= 512KB * 2^3)
|| 101 = 14 MB installed (= 512KB * 2^5 - 2 MB reserved)
||
||
00 SM124 or compatible (found in hardware docu from AURA)
01 SC1435 or comp. (found in hardware docu from AURA)
10 VGA and SYNC monitor (found in hardware docu from AURA)
11 TV (found in hardware docu from AURA)

I hope somebody knows more about this stuff. I really need a complete hardware
register documentation of my Falcon030.
(Perhaps some hardware developer knows more about it??)

Many thanks for your help!

Philipp

Everywhere was written, $ffff8006 shows the type of connected monitor.
But Thomas Binder once found a way to extract the correct
Falcon-RAM-size from that adress!

I found this old Assembler-Listing: (c) Thomas Binder / ST-Computer 11/1993

```
move.w $ffff8006,d0
lsr.w #8,d0
lsr.b #1,d0
move.b d0,d1
andi.b #1,d1
lsr.b #2,d0
andi.b #6,d0
or.b d0,d1
move.l #$80000,d0
asl.l d1,d0
cmpi.b #5,d1
bne.s no16mb
move.l #$e00000,d0
no16mb: rts
```

In 'd0' you can find the Byte-size of the RAM

You can also find this routine for GFA-Basic at 'Download -> PeaSoft
Download -> GFA Basic Bibliothek' on my WebSite (see below)

cheers, Werner

It's from GameFix's source, but it's just a copy from TOS ROM - and IIRC
clearly marked as such, though I'm not absolutely sure (must look that
up).

Ciao

You can either use the hardware scroll but it is very memory hungry.
Horizontal is easy, vertical is simple uses even more memory.
In horizontal mode you specify the width of the screen then the offset in
words and pixels.

For vertical scrolling you can cheat by making the screen wrap around and
updating a small area just below or above the visible screen.

I'm just wondering how TOS knows what machine it's running on.
I'd like to understand how TOS works and how I have to interpret the
informations.
For example yesterday I learnt how TOS is handling the NVM Memory and
how
it is accessing it (Registers, Checksumm,...). I think this gives me a
totaly new view of my Falcon030. (I'd also like to write my own OS).

It is compiled in (at least on Falcon and TT).

TOS 2.06 does some hardware detection to run on both ST and STE.

I'm sure this had become freeware the last time I looked (a good couple of
years ago). Sorry I can't remember the site.

Outgoing mail is certified Virus Free.
Checked by AVG anti-virus system (http://www.grisoft.com).
Version: 6.0.256 / Virus Database: 129 - Release Date: 31/05/2001

Hello !

I have happily used Devpac, since i know of it.

Here's my question; how can i control the Dev
Pacs Debugger, i think it is called just Mon.

Specially i want to go through a programm
step by step and see how memory changes.

how can i realize that with devpacs mon ?

thank you very much, cause i can`t find
a programms error.

Ravi

I think our "Anonymous" friend is right. http://www.berkhan.com/ sells
the latest version of Omikron Basic for 199 German Marks = about 90 $.
If there's a (older) freeware-version I would be interested, too.

>is called just Mon.

>Specially i want to go through a programm step by step and see how
>memory changes.

RTFM !!!!

If youve got a legit copy then you'l have documentation that tells you how mon operates in relation to GEN_ST.

It is not very simple as mon is all keyboard driven with a lot of key
combinations corresponding to the various functions.... the result is you
must open the manual and read it or will not take out much.

4849. [ANN][ES] Stand alone SDK

Newsgroup: comp.sys.atari.programmer
Date: 2001-06-26 12:18:58 UTC
From: Pascal Ricard <paricard@free.fr>
Message-ID: <3b3887b82af12e2@free.fr>
Source record: 1168
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi all,

After a few requests, we decided to make a SDK CD with the following:

ï¿½ The GCC kit
ï¿½ GCC Shell, registered version
ï¿½ Ressource Master, registered version, with paper manual
ï¿½ Windom libraries with their printed documentation (200 pages)
ï¿½ EZ Edit text editor (with syntax "colourisation")
ï¿½ Many development libraries
ï¿½ Many development tools

All this for only 49.00 Euros!

(reminder: for active developers the price remains 75.00 Euros for the
SDK including MagiC).

Have a look at the MagiC SDK page (in French):
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Best regards,
P. Ricard (ES)

4850. Thread safe malloc system in ANSI C

Newsgroup: comp.sys.atari.programmer
Date: 2001-06-27 01:34:40 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3B3937AE.32646604@chello.nl>
Source record: 1169

Crystal clear internal structure. Everything defined in header file.
All kind of diagnostic is therefore possible. A rudimentary routine for detecting
memory leaks is included. (solved a few in XaAES :-)

It handles completely disjunct chains of Gemdos blocks for each thread.

Each chain can have different chunk size and memory type (global, shared, private,
you name it) Chunk size can be changed dynamically to meet changing workloads.

A chain is defined by a root structure that you can start in the local name space
of your thread.

If a request is larger than the chunksize, a multiple of the chunksize is
allocated. This can reduce fragmentation dramatically.
Resulting slack space is not wasted but normally used by malloc (the call
that allocates the smaller portions within a chunk)

The root structure is passed to all malloc calls for the same thread.
A chain or 'memory thread' is defined by this root structure.
This makes its implementation independent of OS in use. No OS related entities
like 'pid number' are used.

It is moderately fast. Not as fast as Pure C malloc, but faster than I found in the
mintlib.

It has ran for half a year in XaAES now without any problem.

You can download it from my homepage via the XaAES link and XaAES_nnn_source
It is in the folder xmemory.

It is for programmers, so the source is its own documentation.
C'mon, it is only a few A4 pages. ;-)

in article <Djd_6.6$Ap5.15511677@news2.randori.com> (comp.sys.atari.programmer)
Wavemaker wrote on Wed 27-06-2001 04:30 (GMT):

> I was wondering if there is a C++ compiler for the Atari ST computer. Preferably
> one with an IDE.

There is GCC. It's free and available on the web. It's the most
versatile one and the only one capable of C++ AFAIK (I'm not a C
programmer yet). It's a little bit memory hungry, 14 MB and a "fast"
machine are recommended (Falcon, TT or up). Have a look at this page:
http://gemtos.free.fr/

A GCC SDK is available on CD at Europe Shareware for 49 Euros, including
some registered shareware tools, and for 99 Euros with MagiC (75 Euros
with MagiC if you are an active developper). Have a look at this page:
http://www.europe-shareware.org/atari/logiciels/magic_sdk.html

Most of these pages are in French, a few are in English though.

Best regards,
P. Ricard (ES)

With the FreeMiNT/SpareMiNT patches, it should compile without much trouble.
GCC 3.0 works fine with the existing binutils, so you only need to recompile
gcc.

4858. Reset???

Newsgroup: comp.sys.atari.programmer
Date: 2001-06-29 12:16:01 UTC
From: Manfred Lippert <mani@mani.de>
Message-ID: <B7623E1E.5455%mani@mani.de>
Source record: 1177

Hi,

how can a "reset" be done by software on an Atari?

I tried just to jump to the reset vector (address 4). It seems to work: the machine resets and is booting. But after this, I cannot get any data from the Midi Port! :-(

If I reset with the hardware button or with Ctrl+Alt+Delete, this works fine.

So I am looking for the "correct" way to do a reset.
How does the system makes the reset on Ctrl+Alt+Del?

Regards,
Mani

That's right. But the problem is that I do not have on my Hades 060, an environment that allows me to compile GCC. I tried several times with GCC 2.95.3, without success. I didn't installed SpareMiNT. I use part of it, but never installed the whole package. If somebody would be so kind as to compile GCC 3.0, and release it on the WEB, it would be nice. I suspect that a few people are currently working on it. I would be interested by the result ...

Thanks for your advice,

CU,

All I have is GFA code maybe this will help.

PROCEDURE kaltstart ! Coldboot
'
VOID GEMDOS(&H20,L:0)
'
SLPOKE &H420,0
SLPOKE &H426,0
SLPOKE &H43A,0
'
a%=LPEEK(&H4F2)+4
a%=LPEEK(a%)
'
CALL a%
'
RETURN

PROCEDURE warmstart ! Warmboot
'
VOID GEMDOS(&H20,L:0)
'
a%=LPEEK(&H4F2)+4
a%=LPEEK(a%)
'
CALL a%
'
RETURN
```

Hi Manfred

>So I am looking for the "correct" way to do a reset.
>How does the system makes the reset on Ctrl+Alt+Del?

I wrote a utility to do that ages ago, i reset memvalid to 0's and some other vectors i dont recall at the moment and jumped to the reset vector, is memvalid is wrong a cold boot is executed, otherwise a warm boot is assumed. I could dig out my code if you want to use it for ideas.

I seem to recall that its not correct for a program to invoke a reset, especially if youre in a multi-tasking environment, data could be lost.

I always just to the address at 4.w it always works.

There is however some flags to set a soft or hard reset but I don't know
where they are.

Here's some assembler that does the same as the above:

**********
*
* perform system reboot
*
* if d0 = 0 warm reboot
* else cold reboot
*
* no return so no need to preserve registers
*
do_reset move d0,d7
clr.l -(sp)
move #$20,-(sp)
trap #1
addq.l #6,sp ; not sure why I bother with this.
tst d7
beq reboot2

*
* clear memvalid flags so memory check performed
* wipes everything from memory, including any
* reset resident viruses
*
clr.l $420 ; memvalid 1
clr.l $43a ; memvalid 2
clr.l $51a ; memvalid 3
clr.l $42a ; resvector
clr.l $426 ; resvalid

*
* get the reset vector mapped from ROM. This makes sure
* the TOS reset routine is called
*
reboot1 move.l $4,a0
bra.s reboot

*
* get the reset vector from RAM. This allows soft-loaded
```

```
* OSes (Mint (?) and Magic) to direct the reset through
* their code
*
reboot2 move.l $4f2,a0

*
* jump to the reset routine and carry on from there
*
reboot jmp (a0)

**********
```

As has already been mentioned elsewhere by Steve Sweet, this isn't a good idea if you're using a multi-tasking system. This is especially bad if there's any form of write-behind caching.

>I tried just to jump to the reset vector (address 4). It seems to work: the
>machine resets and is booting. But after this, I cannot get any data from

>fine.

Strange, as jumping to the address in $4 is the same as using the reset button or Ctrl+Alt+Delete.

>So I am looking for the "correct" way to do a reset.
>How does the system makes the reset on Ctrl+Alt+Del?

It watched for the scan codes for those three keys being pressed coming from the keyboard and, if the keyboard doesn't send a key released scan code for one of the keys before all three are received, it jumps to the reset routine.

Regards,
David Bolt

Is it a free program ? Where can I find it ? Does it work with MagiCMac ?

Anybody knows about a debugger working with MagiCMac ? Or at least MagiC ?

That is usually a funcion of the application and/or the desktop. There
are programs that change fonts, but you sould still need NVDI or
something like it to load in and make available all the fonts you have.

4876. Error in Toolbox header file...

Newsgroup: comp.sys.atari.programmer
Date: 2001-07-13 09:20:50 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <9imele$17nd$1@news.comnet.co.nz>
Source record: 1195

It has come to my attention while experimenting with loading/using my dialog object TLL, that there is a bug in the TLBX.H header file.

The error involves the function prototype for tlbxLibFlags function, and the sizes of the pararmeters to it.

The actual prototype should be

```
uint32 _tlbxLibFlags( uint32, uint16, schar8 *, uint32 );
```

The #pragma and #define lines elsewhere in the header file, and the definition in the direct-call jumptable structure are correct, however.

This fault will manifest itself as being unable to alter the "bootload me" flag of an on-disc TLL file. Any program using thsi function (like the TLL_CONF CPX) should be recompiled.

A new, correct archive file containing the corrected header file and CPX will be placed on the webpage shortly.

When I see such types being used, I can imagine that the prototype was incorrect. :-)

I understand that such types are a way to ensure that the types are of the
intended bitwidth. I suppose they are part of a sort of "compiler.h".

You must realize however that such types are of the 'black box' sort.
What you should have done is ahielding these again from the user by redefining them
once more, like this:

typedef uint32 tllong;
typedef uint15 tlshort:
typedef schar8 tlbyte;

etcetera

These type names belong exclusively to your toolbox suite and should be contained
in the headerfile belonging to the suite.

You achieve that:
the bitwidth remains tight under control,
is of no concern to the user,
is not sensitive to lies, ;-)
and MOST IMPORTANT! is not part of the source proper.

And that is what high level languages are for.

What if you want to port your software to 64 bit systems?

Correct.

> I understand that such types are a way to ensure that the types are

> intended bitwidth. I suppose they are part of a sort of
"compiler.h".

They are typedefs within the "0/types.h" file supplied with the
Toolbox.

When Toolbox development started (about early/mid July 1992). it was
written for my own use as a system-wide way of
loading/unloading/sharing plug-in modules among my programs. At the
time, I had int = 16 bits, and the typedefs reflected this (uint16,
sint16, uint32, sint32).

However, as "int" could also be seen as different bitsizes by some
compilers (Lattice, for example, which could be configured as either
16 or 32 bit ints), I changed my C code to include a separate file
which defined the sizes of the types.

The nicknames also helped me when I later changed over to int=32.

Assuming short=16, int=32, then I'd add

typedef signed long int sint64;
typedef unsigned long int uint64;

to my "0/types.h" file. This will however break when we move to
128-bit systems in the mid/late 2030's as we'll need some sort of
"extended long" type

(or should that be "long long int"? What have ANSI/ISO done about
"longer than long" types?)

(The Toolbox was written entirely in 68k assembly language, BTW)

I have a large box of Atari stuff free if you pick it up.

2 x Atari 800
1 x Atari 400
2 x 850 expanders
1 x 810 floppy drive
2 x Atari 1020 pen plotter/printers still in the box.
RAM cards, ROM cards, a few game carts (Qix, Defender,...),
miscellaneous boards, chips, etc,

I live in San Jose CA. Call quick if you're interested,
otherwise it all becomes landfill.

What is an "850 expander" ?

The number 850 is familiar as an old 8 bit peripheral, but I cannot
recall what it was.

Hello,
I would like to start programming with my old Atari ST again :)
I used just STOS and assembler back in old days, but today I wold
like to use C/C++.
BUT where I can find decent C compiler for ST. Preferably somekind of
cross compiler, so I can write and compile programs with PC , and then
transfer them to ST.

I downloaded Pure C from the www somewhere. I am not sure how it
compares what else is out there, but I am sure there is something better.

What was "Omikron Basic" like?

All the ST language discs (admittedly either UK or US oriented) I've seen have either had ST Basic (either original or the Metacomco "Enhanced" version), or, if you go far enough back, you'd also get ST Logo.

(BTW: I've added "comp.sys.atari.programmer" to the newsgroup list, as this may also be of some help)

> What was "Omikron Basic" like?

Omikron Basic can use libraries (there were a lot of them e.g. the
Easy-GEM-Lib), can run with or without line numbers and has a
pseudo-GEM-Interface. However, at that time GFA-Basic was already too
popular. Omikron is more similar to the classic basic.
There was a version 5 with a GEM editor and horrible looking dialog boxes.

I forgot to mention that the decision to replace ST-Basic with Omikron was
made by Atari Germany - maybe because the Atari market in Germany was
different to the UK/US one.

Do any of you have a "wish list" for features/functions to be added to my Toolbox DLL manager?

For example, I'm thinking of adding a "Call logging" capability, to help a programmer to see the sequence of calls that lead up to a crash/bug/"feature". This will probably be done as a "log calls to me" flag added to the library load/link phase. And possibly a "Always/never log calls to library [x]" CPX that'll allow a user to configure this.

I'm also reworking the Library List accessory ATM.

If any of you are using compilers other than Lattice C, feel free to edit the include and source files within the archive and send them to me - I'll add them to the next release of the Toolbox.

Is there anything like Windows (norton/Volkov/whatever) Commander running on the Atari, ahem with MagiCMac ? There are various archive programs (shells) like Twoinone, STZip, with the two filelist window, but what about a file utility ? Maybe Kobold, but does it work with MagiCMac ?

Best it would be an open project, and put in comparing directories and other features. I'm ready to put my hands in such a project if you can give a starting point, as I do not have so much time to start from "Hello World!".

In uno strano messaggio del 21 Jul 01 swamp-dog@ntlworld.com (2:333/608.1)
scrisse al povero All :
s> iirc Kobold ran/runs on MagiCPC with GEMDOS mode enabled.

Mmmmmm Kobold is a good program with good selection features, tought it has
no directory sinchronization.

But I could only test an old Kobold 3, all in german, it works in MagiCMac,
but the risk to do something wrong with the files is high, as I do not
understand the german messages.

Again it would be best to have an open source project, or get the source for
programs like kobold, even an old version, as a starting point.

Windows Commander is really a nice program 8^)

4908. Want a copy of: Zap! The rise and fall of Atari

Newsgroup: comp.sys.atari.programmer
Date: 2001-07-31 03:59:23 UTC
From: Jeff Thomas <atari_st@bellsouth.net>
Message-ID: <Q1q97.1777$kg.121597@e3500-atl2.usenetserver.com>
Source record: 1127

For the last year, I have been looking for a copy of the book: Zap! The rise and fall of Atari by Scott Cohen. It has been almost impossible to find....until two weeks ago. I was on Amazon.com and found two used copies....yes...but they wanted 97.50 and 172.50 for them. I want the book.....but not that bad. Well...to cut the story short, I found this Web site that will make you a copy of the book...yes..they actually make it when you order it...for $16 bucks. Keep in mind, its not the original...but a copy of the book. The girl I talked to there said that they have agreements with authors to re-publish their work...without the author having to invest thousands of dollars to have multiple copies made. She said that they make the book when a customer orders one. I assume that Scott realized there still was a demand for this book.....so he used this firm to get it back in the market. Get your copy today!!!

Before doing the Fforce(), Fdup() stdout and save this handle. Now
Fforce() stdout to your file handle, output stuff, then Fforce() stdout
back to the handle Fdup() gave you. That's it.

But bear in mind that prior to TOS 1.04, using Fforce() and Fdup() may
cause serious problems, especially when used in connection with Pexec().

Ciao

Ah. I looked into fdup(), it mentioned it could be used to restore
a standard device, but for some reason I just didn't get it. ;-)
This seems to work, thanks!

One more question, maybe a silly one. After I fforce() stdout
back to the handle fdup() gave me earlier, should I fclose() this
handle? I think this is were my initial confusion about fdup()
came from because it's a user handle (>6).

Hello!

> One more question, maybe a silly one. After I fforce() stdout
> back to the handle fdup() gave me earlier, should I fclose() this
> handle?

You should close all handles you don't need any longer.

> I think this is were my initial confusion about fdup()
> came from because it's a user handle (>6).

Fforce() and Fdup() do nearly the same. The difference ist that Fforce()
redirect to the specified handle and automatically close an existing
handle.

Can anybody tell me what is MacMiNT how does it work, if sources are
available, what is the actual development state and so on ? I would really
like to consider an alternative OS to MagiCMac but having the sources to
modify myself.

In my ignorance, I will state that MacMiNT is something like JET (Just
Enough TOS). Very briefly stated, the designer required a bare minimum
TOS operating enviroment for a few MiNT compiled applications. The
package and sources are available on most FTP servers to ponder over
and test your skills. If your a Mac user, MagiCMac would be the way to
go. If your an Atari developer, then you will go your own way:)
Mike

4921. RSC editor

Newsgroup: comp.sys.atari.programmer
Date: 2001-08-09 19:13:54 UTC
From: nospam@zonnet.nl
Message-ID: <ShBc7.25642$Vs4.256568@zonnet-reader-1>
Source record: 1140

What is a good up to date resource editor to use. At this moment I'm working with RCS30.PRG a beta from Digital Research released once by Atari I believe. I'm looking for a better one.

With RCS30.PRG sometimes when I use this to edit resource files from newer programs, strange things happen. Even if I just load and re-save the RSC file without changing anything, something seems to change, and the program doesn't work correctly anymore.

Try the KResource RCS program...you can download it from:

<http://groups.yahoo.com/group/atari-midi/files/Programming/Kresorce.zip>

I am working on creating a .pdf (Acrobat) file of the docs for this
resource editor...but the going is slow because I do *not* have the
Adobe tools... Let me know if you are interested, and I can inform
you when I get it done...

That's almost as outdated as RCS30 and shouldn't be used today - Gerd Hï¿½ller has the distribution rights for Interface, contact him at hallo@hadley.de.

The most up-to-date resource file editor is ResourceMaster 3.20, sold by ASH.
ATM it's in German, with a DDP release of an English resource expected.

The next best is Interface, once commercial but now available on the web for
download:

http://www.hadley.dusnet.de/gfa-basic/dateien/intrf233.zip

You can find the English resource file on my web site, MISC section.

It won't load some resource files from the most modern applications, only
ResourceMaster.

From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <27988_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 1145

Is there anybody who tested the HighWire project ? As I work in MagiCMac and avoid the crashing Lattice IDE I prefer to use a makefile for the project, but HighWire has source files with longnames, and make.ttp does not work with them, of course I am able to compile modules one by one, or rename the sourcefiles, but I would really like to see if anybody has a make.ttp working with longfilenames in MagiC, maybe a make from MiNT/gcc packages ?

Can you help ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Very nice, I was able to run the compiler with MacMiNT, even with the basic
incomplete installation, it was worth for something in the end 8^)

Is there any trick to run directly in MagiCMac ? The linker has no problems.

Dunno about vpac3 but this issues "Hello World" to Cconws(). Should be
easy enough to modify...

```
/ module name c

.shri

.globl main_
main_:

.strn

L2:
.byte 72
.byte 101
.byte 108
.byte 108
.byte 111
.byte 32
.byte 87
.byte 111
.byte 114
.byte 108
.byte 100
.byte 0

.shri

link a6, $0
pea L2
moveq $9, d0
move d0, -(a7)
trap $1
addq $6, a7
unlk a6
rts
```

You can remove the 'link/unlk' instructions which, aside from the
"stupidity" of all the 'byte' instructions, is a great big clue that
the above was generated by a compiler! ;-)

Hi,

Anybody know of a C compiler for the Atari 800 (The original 800,
not the XL)? I have certainly seen them for the Atari ST computers,
but I can imagine it would be difficult to implement in 48K.
I recently purchased an old 800 on eBay and thought setting up a C
compiler for it would be a neat project.

Thanks,
John

Hi John

There was a C compiler available through the antic catalogue. It was called "Deep blue C" there was also a math library that allowed for floating point functions (if I remember it right). I managed to get it on sale just before antic publishing went bust in the early 90's. I'm not sure who originally wrote it or if its available as shareware/freeware or not. I think there was also a shareware version called CC65? I'm not sure if I remember that one correct but it might be available on an ftp site or in someones collection.

Thanks very much, it worked 8^)

I still have problems with the interpreter tought I use ALA_CARD, what
version should I use ? Other solutions ? I can use the interpreter in single
mode only.

Can it be done ? How ?

I have an old program written in GFA basic, sources are lost and I only need to intercept few routines and modify them, so can you suggest how could I patch the program ? I see there are a lot of pathing programs around for updates and fixes, so it should be possible, can anybody give tips about what software to use and how to identify the exact point to intercept and then how to write new code and how to stick it to the old program ????

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

Patching works the way that you two programs: program a (old) and b (new). The patch generator generates a patch file which includes the difference between these two. I've got a patch program for HomePage Penguin updates but I think that you still need the source code. Without deep knowledge of the assembler language it's almost impossible to write a patch program for a program for which sources are lost.

I know of one free patch program: "Diffy/Patchy".

Greetings,
Matthias

I have that deep knowledge of asm, I do not have deep knowledge of how the
GFA compiler produces executable, to identify various calls. The second thing
is when I know the point I want to "break into" the program, what should I
use to stik the code and how ? Suppose I want to add a new routing writing it
in C or ASM and compiling it in a binary file, how do I correctly jump in and
out ? I guess I should attach the new code at the end of the old program and
then just jump in and out at correct addresses, but what about the stack and
other recommendations about GFA ?

Another way would be to disassemble all the program, maybe with TTdigger,
until you obtain a working asm source and then recompile all.... can you also
help about this way ?

Hi,

Just one question.
Is there any possibility to check if my Falcon has CT1, CT2,
Afterburnen, Nemesis or any other accelerator and if it's active or not?
Routine in C would be the best solution for me of course.

Open the case and have a look whatï¿½s up. Best way ;)

> Routine in C would be the best solution for me of course.

Sorry, i doasnï¿½t know about a routine that check these kind of
accellerators. Best way anyway (my opinion) is to made a software that
do that all. Benchmarks, Ramtest, Displaytest and some else include.

Canï¿½t remeber me to see a software that can do that.

Regards, Robert

As far as I know, that is probably the only real way to do it
and it will be alot of work. Since you lost the source
you probably didn't turn on the symbol table option when
you linked it originally. I assume this is a very important
program to you if you would go to this trouble? How big
a binary are you refering to here? I'm curious. ;-)

About the interpreter in the previous msg. If you would prefer
to avoid the gfa interpreter entirely there is a solution.
It is possible to use QED or your favorite text editor to
code gfa programs.
Have a look at my web page, if it interests you just let me know.

Don't now if it can be done directly (without opening up the
machine - which may be the easiest thing to do!) but if you only
want to know whether the Falcon is accelerated, run Profile 2.22.
This will give you something starting like:

PROFILE v2.22 by Linnhe Computing - Mark S Baines (c) 1994, 1995, 1997

Hardware, TOS and Display
~~~~~~~~~~~~~~~~~~~~~~~~
Machine type: Falcon030 computer
Central processing unit (CPU): MC68030 (cookie jar)
Central processing unit (CPU): MC68030 (hardware test)
CPU speed relative to 8MHz MC68000: 4.37 times (equivalent to 35 MHz)

and this speed varies depending on whether there is an accelerator
or not. With Nemesis on Low I get 5.62 times (45 MHz) and with
Nemesis on High 6.75 times (54 MHz).

Note that this program has a problem under MagiC - the sub-menus
don't work and crash the program. But you can see the first page
with the above info as soon as you run the program, and can output
the complete test to a file and read the details from that. The
program was shareware but is now freeware, I think.

Regards, /Peter/

Well, I'm _not_ trying to make a tester. I'm trying to make a programm, that runs different
routines for different accellerators.
First I have to check if there is an accellerator and then call the different routines for
different accelerators (or one routine with other parameters).
So, it makes no sens to call Profile or something else to check if there is an accellerator
or not. It's simply impossible.

While reading a recent computer mag, I came across the name "True Basic"

It was the name of a computer programming language and was written in the 1980s by the originators of the Basic language (John Kemeny and Thomas Kurtz)

Was there ever such a language available for the ST?

All the Basics I can recall for the ST are : ST, GFA, Power, Hisoft, First, STOS.

(I've played with "Enhanced" ST, and Hisoft/Power BAISC, but haven't seriously used Basic since I converted to using C [Megamax/Laser/Lattice] in the late 1980s)

Yes I tryed yesterday and I am perfectly able to disassemble and then
recompile in a perfectly equal program. Will have a look if I can trace
routines and do some changes.

se> you probably didn't turn on the symbol table option when
se> you linked it originally. I assume this is a very important
se> program to you if you would go to this trouble? How big

The program is not written by me unfortunately, it's"net2net" that I'm still
using to gateway these messages on my FTN system. The author stopped the
project when his Atari hardware had a failure and was not able to recover any
backup, just at the time he decided to pass me the sources to continue
development. One other guy restarted the project again starting from the
beginning but stopped after the first GFA listings, so I am alone, and it
seems easier to correct small things in the previous software then go on with
the new project, as my system is running for years. Another problem is not
having a debugger working in MagiCMac, having the GFA interpreter or the
PureDebugger working would speed up my development. For many things at the
moment I prefer to use VisualC and standard libraries on a PC, debug the
thing then port the source to the Atari, obviously I can't do anything about
the GEM interface, AES calls and so on.

se> About the interpreter in the previous msg. If you would prefer

I will have a look, but the interesting part of GFA is the "live" editor
itself and the quick way to test the code before compilation.

Does anyone have a fast atari 8 bit divide routine?
The best I found so far is:
---------------
8 bit unsigned divide

ldx #8
lda dividend
div cmp divisor
bcs s
sbc divisor
s rol quotient
rol
dex
bne div

timing in cycles:
overhead 5
"0" bit 20
"1" bit 18
range 148 to 164
average 156
unrolled, with dividend in A register, and last iteration optimized: 105

average of 14 cycles per bit.
dividend, quotient, and divisor are 8 bit values stored in zero page.
The remainder is left in A.
note: dividend/divisor must be < 2.
---------
This person mentions two faster methods, one of which uses tables.
Any ideas?

Thank, found and clearly stated it is _shareware_ and that it needs a key
code.

So what ?

Well, it's also possible :-)

>Run simple benchmark tests on both ramtypes and CPU optimizations
>

I don't want to make any program, that tests the speed. I need to know
if there is or not an accellerator.
So, the idea with checking for CPU and FastRAM is very good.
But there are also such accelerators like Phantom, that don't gives
either new CPU or fastram...

Hi,

I am looking for ideas for a challenging Atari 8-bit assembler
programming project. I would like to write something that would be
useful to a lot of 8-bit users. Is there something out there that
would genuinely be useful, but has been just too tough a nut to crack
for anyone to take the effort?
I have about a year of x86 assembler experience and 14+ years
of C/C++ experience on the PC platform. I can handle difficult
complex programming projects.
I am new to Atari 8-bit computers. As a hobby I have recently
started piecing together the Atari system I always wanted has a
teenager. I have been having a lot of fun with games, but now I want
to start exploring the Atari at a programming level.

You might consider the MyDos utilities that Andreas requested a couple of
weeks back; it's definitely big and challenging.

Hi,

I just started working with the Atari Macro Assembler and the
Atari Program-Text Editor. I am new to Atari Assembler. Every time I
try to assemble my test source file I get an error on every line.
Obviously, I'm missing a concept somewhere 8-).

If someone could post a simple hello world source listing it
would help me a lot. I could at least know that the source code was
correct and focus on the mechanics of the assembler.

Thanks,
John

I think it would be really useful to make a library of useful routines, like disk i/o, setup graphics mode, plot, return model #, cpu speed, fetch ram pages (including several K amounts of continuous memory), extended and expanded memory accessed (that is, dma based and i/o page based), sound access, keyboard read, joystick read, and zero page location request (again, request several zp in a row).
the reason I say this is cross model and platform compatibility, which can lead to a C standard library for the cc65.org compiler so that you can make a nice project and all 8bitters can use it. There are so few 6502 programmers left that we have to gather the strengths of all 8 bit platforms to proceed as a community.
Just my idea.
I can tell you for sure we would need:
fetchkeyraw - return raw keycode for this machine (atari ascii or whatever)
raw2ascii - convert (as closely as possible) atari ascii to standard ascii

raw2xtra - convert atascii to some kind of standardized extra keys, like F keys which commodore/atari have, cursor keys, etc.
getpage - reserve 256 bytes of memory anywhere and return pointer like $60 means $6000-$60ff
getpages - get N pages continuous (for those who need 1k tables etc.)
getfar - read ram under rom, or ram expansions etc
storefar
howmanyjoy - return # joysticks
readjoyN - read a joystick
readpaddleN - read paddle
writefile - open a standard temp file - call it anything - and close it
readfile - read the file back (can be used as bare minimum to save prefs, highscores etc.)
should save an area of memory, save as 8bit bytes
cpuspeed - return cpu speed in cycles/sec
settimer - start a cycle timer if possible
stoptimer
settimeraddress - where the interrupt starts exectuing
getzp

This is nothing fancy but I know from experience that the bare minimum of routines to make any decent program is access to memory #1, access to timers and input/output, then files, then sound (sound is probalby not essential for most things).
Text modes can be almost exactly the same on good enough platforms - comoodore/atari can have 40x25 text screen, and 80 column text screen can be simulated with this (or real 80 column for commodre 128).
Bare minimum graphics are also compatible, saw black plotting on white in 320x200, this is enough for graphs and so on, but I don't expect this to be amultiplatform gaming thing - though even games can make use of standard joystick/paddle/keyboard/ram access.

Hi,

Thanks, for taking the time to respond to my posting. I really
like your idea of a 6502 assembler library. That will let me start
with simple objectives and build from there. I have to admit; I have
found the Atari 6502 platform a little more difficult to pick up than
I had first thought. There are some incredibly powerful assembly
tools for the Intel x86 platform that just do not exist on the 6502
platform. However, I have had a few small successes.
I can tell I am farther from tackling a big project than I
thought. But, I am undeterred. There is a certain technical
aesthetic artistic and historic quality to these machines that I
really enjoy.
Anyway, I think the idea of starting small and building a
foundation library is a good idea. That is how I plan to proceed at
this point.

Thanks,
John

Glad you like it - but, there are some powerful 6502 assemblers, one's even called MASM :) I heard one called ACE by a commodore guy is good, of course you can use it for any 6502. There's an assembler that comes with the C compiler at www.cc65.org as well. All the usual like macros, conditional assembly etc. are available. You should realize also that you can actually count cycles on a 6502 without worrying about cache hits :)
All legal instructions are 2-7 cycles, but most are 2-5. Be aware that accesses to the lower 256 bytes of ram are one cycle faster, and also that's the only place you can store pointers for indirect addressing modes.
Usually it's faster to use absolute mode, to clear ram use sta $1000,y:iny:bne loop
instead of lda #$10:sta $03:ldy #0:sty $02:sta ($03),y:iny:bne loop
or even sta $1000,y:sta $1080,y:iny:bpl loop
If you have any questions about learning 6502 plz post.
good luck
ps if you start writing and then post your code, I can help you optimize it then you can learn some tricks from our land.

is it possible do write 6502 assembler code on a real pc, compile it
with a real pc and just run it on some emulated enviroment just like
the atari800win? If so, it could be easier to do more complex programs
and also faster I think.

What software is needed to do this task?

Yes. I used to use TASM from Speech Technology<?> on occasion. I first
started using it on an ~8 MHz Tandy 1000. It was an OK environment, 80
column editing, file I/O on a IBM vs Atari 1050 was probably 100 times
faster. The assembler itself was probably 10 times faster then ASM/ED cart.

Some of the code I wrote, I ran on Xformer to test Xformer/emulator more then I wanted to run an emulator, but I could have done everything on a PC.

My problems with a set up like that were pretty specific to me and the way I work. I like to use a combination of things like BASIC to make data files and altered character sets for inclusion in my ML stuff. Having 1/2 the program files on either a 1050 or .ATR and the other half on the IBM made for some problems with moving them around. It was always just much easier do everything on a real Atari.

Well as it transpires I've had to sign up to yet another IP and this seems
to have cured the problem, as I now get current traffic. '

4994. Can I use a text source file w/ Atari BASIC?

Newsgroup: comp.sys.atari.programmer
Date: 2001-09-07 18:50:28 UTC
From: john@jrcc.net
Message-ID: <de16c5ec.0109071050.6a785c14@posting.google.com>
Source record: 1063

Hi all,

I have a large Atari BASIC program that I am going to be entering
from a book by hand. Sound familiar? Anyone... Anyone...

I would rather key this program into a full screen text editor on my
PC and transfer it over to my Atari 800. Which I can do. I have
Steve Tuckers APE software and a SIO2PC cable.

Can Atari BASIC use an ASCII text source file? I have looked at
BASIC programs that I have keyed into the BASIC interpreter and save
them to disk. They are not saved in a text format. I am not sure
what format that are save in, frankly.

Any ideas?

Thanks,
John
john@jrcc.net

Hi all,

I am working my way through the Richard Mansfield book; Machine Language for Beginners (c)1983. As anybody got the Atari source code for the SIMPLE ASSEMBLER already keyed in. If you do could you either post it to this news group or e-mail it to me. It would be greatly appreciated.

An .ATR disk image would be awesome!

Thanks much,
John

This should be a faq of some type! Yes you can develop completely on PC. I do for the c64. Someone else here should have answered by now, as I'm no expert on Atari, but the basic setup is notepad to write code, a command line assembler (use doskey, then it's two keypresses to reassemble), then convert the binary into the right format to load into the emulator (in my case I found an assembler that directly creates emulator type files), then attach the image in the emulator - at least for commodre emulators, you have a simulation of a disk or tape as an image file, once you attach that file then you can load programs off that file through the emulated machine, in my case I attach test.d64 as a disk image, then in the 64 itself type LOAD "assembler",8,1 and start it with SYS49152.
I don't really know how to do the equivalent in Atari, but to run assembly programs on Atari I used to POKE data into $600 or 1536 and they type DOS as that would start the program. Problem is, this is meant to start a menu program that lets you access your disk drive, but I never had a real disk drive. The other way to start assembly from basic is the usr(x) function. If you check a memory map, there's a USR vector, you poke that with the start address of your routine, then type x=usr(1) in basic. The "1" gets copied as a 16bit value somewhere if you need to use it, then your routine is called, and you can pass a value back.
Is there a SYS command in atari basic?

Several options, John...
First Atari Basic *cannot* use ascii because it is line oriented and would never find the $9B end of line.

However, TextPro likes them just fine and has a global replace mode; you can do Ctrl-G to convert Esc, Ctrl-M, Esc, Ctrl-J to Esc, Ctrl-LeftArrow and it cahanges all to Atari Return's. Save it back out and then ENTER it into A8 Basic as a LISTed file.

Another handy utility is Ken Sider's W95 Image manager; it allows you to import/export files to the .ATR in binary or translated text format. All that remains are the inverse and control character stuff to clean it up.

Main thing is to pretty much stay with the LISTed files, although I have also typed in WordPad, import translated text to the .ATR, ENTER into A8 Basic on emulator, SAVE tokenized file back to .ATR, export binary file from image, AtariLink the file to a SSDD disk and LOAD it on a real 8-bit... whew!

4998. EmuTOS released (very alpha)

Newsgroup: comp.sys.atari.programmer
Date: 2001-09-08 19:24:40 UTC
From: mdoering@mucl.de
Message-ID: <3b9a6dea.216280@news.cis.dfn.de>
Source record: 1067

Hi!

For those of you, who are interested in coding operating systems for the Atari or it's emulators EmuTOS could be interesting:

EmuTOS is a singleuser singletasking operating system for Atari ST computer emulators. Today it is just running on STonX. But my intention is to have it running on every Atari ST emulator available some day.

It is thought as a replacement for the TOS-images you usually need today on these emulators.

EmuTOS is based on Digital Research's GEMDOS sources, which was made available under GPL license in 1999 by Caldera, and so is EmuTOS.

You will find it at:

http://www.mucl.de/~mdoering/emutos/en

You can poke into page six, but execution is X=USR(1536) to start running at that address; the USR(addr) is essentially our implementation of the SYS command.

USR(addr[,P1, P2..]) is *not* a vector; it is a function that acts on the first parameter in the parenthesis as an address for machine code execution. Any second and following optional parameters are converted to 16 bit numbers and placed on the 6502 stack; your routine must clean the stack before the RTS back to Basic.

Typing 'DOS' will *not* execute code in page 6 unless you put the '1536' address into page zero locations 10-11 which is the vector Basic looks at to find where to run the file management system program.

John;

That is a good book; my dog-eared copy is nearly falling apart. Be cautious; IIRC, their explanations of the BCS and BCC instructions were exactly reversed.

You can sure learn a lot by going thru their code and typing it into the system, but I would recommend Synassembler, Mac/65 or the Atari MacroAssembler for any serious development work on the A8. The old ASMED cart is even not bad to learn on with its fairly adequate monitor/debugger.

I'd have thought someone else would have answered this! I'll try but
it's been a long time...

Do you need to top a specific program or just ensure yours isn't the
top one? For the latter there's a message (possibly xx_BDROPPED
xx_BOTTOM?) that will send your window to the back. For the former, I
can't remember if there's a better way than sending the relevent
window a WM_TOP(PED) message as though you were the desktop (app might
ignore it otherwise - indeed no guarantee anyway). There's a couple of
calls that allow you to "iterate" the processes & obtain the
information. Sadly I can't remember the names of the calls at this
time. :-(

Possibly...
appl_getinfo()
appl_find()
appl_search()

Why not join Matthias Belitz's ASPI project?
OK, so the BlackBox version is ready, that leaves quite a few other SCSI or IDE interfaces.

CU Mathy van Nisselroy

PS ASPI (advanced SCSI Programming Interface. But it's really software!!) eliminates the need to write all the tools for all the different hardware devices in that it separates hardware specific code from non-hardware specific code. That way, you can use for instance my CD Audio Player utility on a BlackBox with the BlackBox version of ASPI, and on a MIO or KPI or MSC-IDE controller if we had ASPI software it.

Source record: 1077

```
Hi,

Hi if the application has a window open, you could top this window.
To go through the window stack, you can use following process (untested!)

*****************************
wind_get(0,WF_TOP,&topwindow,&owner,&next_window,&dummy);

while((owner!=ap_id_of_desired_program)&&(top_windo!=0))
{
top_window=next_window;
wind_get(top_window,WF_OWNER,&owner,&is_open,&previous_window,&next_window);
}
if(top_window!=0)
{
wind_set(top_window,WF_TOP,top_window,0,0,0);
}
*****************************
As I said, this works only if the application has a window opened.

I just found a much better way:
*****************************
wind_set(-1,WF_TOP,ap_id_of_desired_program,0,0,0);
*****************************
This feature is only available with MagiC 4 and later versions.

Good Luck
Philipp

Hi!

GH>Do you need to top a specific program or just ensure yours isn't the
GH>top one?
GH>[...]
GH>For the former, I can't remember if there's a better way than sending
GH>the relevent window a WM_TOP(PED) message as though you were the
GH>desktop (app might ignore it otherwise - indeed no guarantee anyway).
That way you will not be able to top programs without an opened window.
There's a better way:
For N.AES you can use appl_control(), for MagiC there is an undocumented(?)
message you have to send to the screen manager:

msg[0] = SM_M_SPECIAL; /* 101 */
msg[1] = your_id;
msg[2] = 0;
msg[3] = 0;
msg[4] = 'MA';
msg[5] = 'GX';
msg[6] = SMC_SWITCH; /* 2 */
msg[7] = new_top_app_id;

Somewhere I have a TSR which provides appl_control() under MagiC...

Thanks! That worked only insofar that the menu of the application was topped, not the window, though. But I realize it's no good if you don't know which window to top exactly. Is there a way to find out? I guess it will be application dependent. I'm specifically concerned with CAB. I send it a file to open, with shel_write if it isn't running and with appl_write if it is. Is there a way to find out which window I then have to top?

Hi,

I am looking for any software that will let me decompile/extract the source
for my old Atari Xl games I have on floopy disk.
I had a whole bunch of programmes a few months ago when I was supposed to
decompile Mountain King for a few people (but my floppy drive broke and I
lost the apps).

I want to document the code for all the games I own (300+) and display them
in txt file formate on a new web page i'm creating.

Also, is it legal in this case (atari XL) to post the code for these games?
I know the jaguar is open source but i'm not sure about the issues regarding
all other systems/games.

3Y3

Any links or info would be much appreciated,

The act of decompiling the code is illegal, its theft of intellectual property. Posting it compounds the issue.

Hi Jos!

JDB>I send it a file to open, with shel_write if it isn't running and
JDB>with appl_write if it is. Is there a way to find out which window I
JDB>then have to top?
The only thing you can do is to top the front most window of the application.
You can get it by walking through the window stack with wind_get(WF_OWNER)
Everything else will be application dependent or not reliable

I have approx 350 Atari games on floppy disk that I play on my Atari XL system. I have been asked on several occasion by many people If i could send them code for certain games (such as mountain king). I plan to disassemble each game and post the source code on a site i'm creating for easy access. Cetain games I will not decompile certain games due to legal tradmarks (such as starwars, star trek ect..)

This will be mainly to help promote preservation of older games so that they do not become unplayable as new hardware makes the older stuff even more obsolete. I wont be making any of them into ROMS (which some people wanted me to do), this will be rather a programming reference as well as a site for atari information.

I just want to offer a site where atari fans come come and learn more about the system and the programming that went into creating these great games. (i'm even thinking about having a simple version of BASIC on the site, so people can try doing a few simple programming tutorials without having to download the emulator or own the system.)

Thanks. That's exactly what I'm doing now. Still, I can't find a way
to walk throught the window stack and the window stack only. The way
suggested by Philip Donzï¿½
(wind_get(...,WF_OWNER,...,&previous_window,&next_window,..) doesn't
work. I don't get any workable values in the other ints.

What I do now is

```
for(i=1;i<100/*big enough*/;i++)
{
wind_get(i,WF_OWNER,&owner);
if (owner==id)
break;
}
```

but it seems so dumm and brute-force like...

This feature is not present on old systems. You can check for it's presence
by
JDB>What I do now is
JDB>
JDB>for(i=1;i<100/*big enough*/;i++)
JDB>{
JDB>wind_get(i,WF_OWNER,&owner); if (owner==id) break;
JDB>}
JDB>
JDB>but it seems so dumm and brute-force like...
I wouldn't do that. The result of this code is a (for the user) unpredictable
behaviour (which is a big NO for ergonomic software). IMO it's better to let
the user explicitly top the window he wants than to "randomly" top one

And a rather ignorant point of view which solves many problems with
compatibility issues is this one:
Modern software requires a modern OS.
No modern OS -> no modern software/features

There's a couple of toolkits around, or was. The one I'm thinking of
also supported GFA but its name escapes me - I've got "EGEM" stuck in
my head.

Failing that, I recently uploaded "lib.zip" to my site - follow the
[Atari->Programming] link. Take a look at "g/FORM/formprin.c" the body
of which is reproduced below. Looking at the code it is apparent to me
that the lib.zip I recovered came from a time just after I got MagiC
and is a "development", rather than a "release" version.

```
#define DEF_BOXCHAR

int b;
char **r;
/*[ bool form_printf(x,y,b,r)
int x,y;
int b;
char **r;

Revamped Form_Printf(). This one should be truly rez independent.
x,y are the form position at which to appear, passing NIL for
x or y centers on that axis.

'b' is passed as zero or a positive value. A positive value
results in a button which counts down for 'b seconds' then
automatically returns. Passing a zero value results in a normal
'ok' button.

The form is elaborated a little when 16+ colours are detected.
Form_Printf() returns false for failure, true for success.

5027. Opening files

Newsgroup: comp.sys.atari.programmer

Source record: 1096

```
Hi,

I'm not sure if it's the right group to send the question, but...

Is there any limit (under SingleTOS) of maximum files I can open?
I'm trying to open some files from my apps and after about 15-16 files
the system can't open any other file.
So, is it a problem of system (is there a patch for that?), or a problem
of my language (pure C) or something else (what?) ?

It's a limit of the given OS, each version of the OS could have
different limits on total open files. At least the compendium
says this, I cannot find what the limits are however. Perhaps
someone else knows where to find this info.

As far as i know (i havn't done it but a pal of mine did something similar)
you can do this.
Of course just copying and pasting the code into basic will not do it, as in
some cases you might need the actual sprite files (but most often the sprite
data would have been coded into all that code your pasting).

I'll have some code available on a web site thats in development by the end
of november. I'll post the link if anyone is interested then.

It is a snap... clean up the OCR scan in WordPad or any editor you can search and replace ones for lower case L's or upper case I's and zeros for upper case O's.

Next use Ken Siders Atari Utility for Windows to insert the file into an .ATR image and ENTER it into A8 Basic on your emulator. If you did a fair cleanup job, you will have only a few error lines displayed. If you have more than one screen full, then LIST it out to a file, and bring it up in TextPro to search for 'ERR' and fix the lines. After you have it checked by DCheck or Typo you can SAVE the code to a tokenized file.

Yes there is a limit.
The limit depends on the machine
On a ST it was about 70-100 (i forgot the actual amount)

So you have a Falcon ?
On a Falcon it was 18 0r 19
On a TT about 70

As far as i know there is no patch for this.

I think it's 18 or even 16 :/
But why Falcon has this limit and ST 70-100??? It's strange...

> As far as i know there is no patch for this.

Arghh...

Thanks for all your answers. I could not find this in the Compandium and in
Profibuch...

Do you know a way to avoid this problem? Can I change something to open more
then 18 files?
Patch (as you said there is no pathc for this) could be a good solution... Ah,
it has to work under SingleTOS, MiNT and MagiC.

I have no idea why you wish to open so many files, however the
best work around I can think of is to load some of them into
ram, then close them. Then write them back out after you modify
them. Assuming they are small files this could work.

Why? I'm working on a game and for some reasons I need to open so many files.
However I do it only once...
I can't load them into memory, because some of them are pretty big (about 300 kB - I know one such file it's not big, but 5-8 such files it's quite big ;-)).
Actually Frank Naumann solved my problem :-) It's really easy and if you want to know how to solve it let me know (or better Frank).

Source record: 863

Hi!

I would like to talk to someone who could help me or write me a very simple program that would read a file byte by byte from floppy disk and place it from $E00000 to $E30000.

I would also like another program to read from $E00000 to $E30000 and put its contents to a file. The file sizes are 2^17.

I don't need any GUI or anything, not even a fileselector is really needed. I did do this with Bload/Bsave with Basic but on my ST it had problems using that address space.

Thanks in advanve.

Another possibility, but it won't help much...

Have a look in <stdio.h> for (hopefully) a macro _NFILE_ and/or
FOPEN_MAX. This defines the upper limit for simultaneous fopen()
files. It tends to be low, about 20 although often compiler docs used
to state it could be changed but even so, that would be implementation
dependant. Unfortunately, as others have stated, there are wildly
different amounts between different TOS versions. I recall getting
more than 40 handles (with Fopen) on my original 1Mb STFM 1.2 but
only in the same directory - if I attempted it in multiple
directories the 40 folder bug would strike.

Atm it would appear that your only solution is to buffer your file
handles in some way.

Care to elaborate on why you need so many files open? I'm curious! :-)

> files.

First, this doesn't have anything todo with the system limit of maximum
number of open files and second this means:

FOPEN_MAX

Number of streams which the implementation guarantees can be open
simultaneously. The value will be at least eight.

Tschuess

If think Frank will do it better then me ;-)
But the main idea is to open as many files as you can. If you want to open more files,
then first you have to close another file, but with saved in memory: file name,
actuall file position etc.

Yes, exactly ;-)

> Care to elaborate on why you need so many files open? I'm curious! :-)

I'm porting a game (Tales of Tamar - a preview of this game will be published on
the upcoming ST-Computer CD) for Falcon and for some reasons I need to open more
files at the same time.
Probably I could load the files into memory, but I would eat to much memory (some
files are bigger then 300 kB) etc.

Yes, sorry. It is $E00000 to $E3FFFF and the file size is roughly 256k,
or 2^18.

OK, Bload/bsave doesn't work on STs when accesing the ROM, yet it does on
my STE. I have Lattice C but see no way of writing to address space.

I also tried buffering to ST memory and then using a peek/poke loop to
move the data from ST memory to that above address range but it took 15
minutes to do only a tenth of it! Mind you, this is an interpreter. I
also have Hisoft Basic. I also don't know how to check where to place a
buffer in Basic as there didn't seem to be a way to ask the OS for memory
space like you can in C.

Thanks.

Oh, I was able to poke in that address range (actually E00000-E3ffff) and
peek back the right values. I'll try compiling a version to speed things
up but I do worry about guessing where to place my 256k buffer as some
program may write over it.

No, I think I should explain what I'm trying to do. I've put battery
backed memory at $E00000-E3ffff on an ST. I designed a circuit to switch
between TOS 1.02 and whatever is at that above address range. If I use
TOS 2.06 image it already has the right bit to say the starting address,
$E00030 IIRC. I've also switched ROM signals to make it search there
first time it's turned on.

I need a program that can read a file and place it's contents at this
address range to update the memory. Peek/Poke is very slow, even when
compiled to max speed. About an hour.

One point: The ROM space from a machine with TOS >=1.06 is 256k (ie
2^18) - so you need to extend your range to 00E00000 thru 00E3FFFF,
not the 192k address range you've given or the 128k file size (2^17)
[TT's and Falcons have larger TOS's])

I'd attempt this on my TT, but I can't seem to find the "Enhanced" ST
Basic it shipped with - I'll look and see if it's feasible. (Do you
have access to any other development tools than ST Basic? I normally
write C or 68k assembly code - I haven't written any serious Basic
code since the late 1980s, so my attempt may be less than
ideal/efficient)

I've some time to waffle. Beware! I'm tired! I can go on and on and
round & round in circles for ages. See, I've started already :-)

You could "front-end" the gemdos functions perhaps. Something like
this, although obviously I've got <stdio.h> in mind here because I
can't remember the details of the gemdos functions well enough!!!

```
typedef struct {
char * fn; //filename
char * fa; //file attributes
FILE * fp; //or NULL if currently not open
long sp; //saved seek position
BOOL fe; //ferror(fp)
int en; //errno
unsigned long ac; //"access count"
} MFILE;

MFILE* mfopen(const char fname[], const char fattr[]);
void mfclose(MFILE *mfp);
int mfread(void *bp, size_t bs, size_t n, MFILE *mfp);
int mfwrite(const void *bp, size_t bs, size_t n, MFILE *mfp);
long mftell(MFILE*);
int mfseek(MFILE *mfp, long offset, int whence);
```

The (MFILE*) returned from mfopen() can be treated almost like
(FILE*). The idea is that mfopen() also saves a copy in an internal
list, called 'mfpa' for example. 'mfpa' is big enough, or can become
big enough, to hold a pointer for each file that can possibly be
opened. When this list contains the same number, or more, of open
files as can be reliably opened then it'll need to close one of the
files which is already in the list - the file accessed the least
perhaps. Having done that, it can place the new (MFILE*) into a vacant
(ie NULL) slot within the list then really open it: I reckon you need
to do that immediately to avoid dealing with "postponed fopen()
failures".

You might close the least accessed file like this...

```
static BOOL
FileContextSleep(MFILE *mfp)
{
if (!mfp || !mfp->fp)
return FALSE
;

mfp->sp = ftell(mfp->fp);
mfp->fe = ferror(mfp->fp);
mfp->en = errno;

fclose(mfp->fp);
mfp->fp = NULL;

return TRUE;
}
```

...which could be restored thus...

```
static BOOL
FileContextAwake(MFILE *mfp)
{
assert(mfp && !mfp->fp);
if (!mfp->fe)
return FALSE
;

mfp->fp = fopen(mfp->fn,mfp->fa);
assert(mfp->fp);
fseek(mfp->fp,mfp->sp,SEEK_SET);

return !(mfp->fe = ferror(mfp->fp));
}
```

Btw I've used assert() merely to highlight something that needs
thinking about. The FALSE return above is because in my mind I see
little point in making an attempt to reopen the stream when it was in
an error condition anyway. ;-)

These MFILE's need creating & destroying...

```
static MFILE *
CreateContext(
const char fname[],
const char fattr[]
)
{const int lfn =strlen(fname),
lfa =strlen(fattr);
MFILE *mfp =malloc(sizeof *mfp + lfn + 1 + lfa + 1);

if (!mfp)
return NULL
;

mfp->fn = (char*)&mfp[1];
strcpy(mfp->fn,fname);
mfp->fa = &mfp->fn[lfn + 1];
strcpy(mfp->fa,fattr);
mfp->fp = NULL;
mfp->sp = 0;
mfp->fe = TRUE;
mfp->en = SUMFINK; //some relevent initial E_?? condition
mfp->ac = NO_ACCESSES; //zero ;-)

return mfp;
}

static void
DestroyContext(
MFILE **mfp
)
{
assert(*mfp && !(*mfp)->fp);
free(*mfp);
*mfp = NULL;
}
```

And that's where I'll have to leave it I'm afraid. A very long compilation has just died & is demanding my attention. Typical. Nothing ever goes wrong when you stare at it. Drop yer pencil & bend down to get it. Phzitt - error! :-|

Ah, but I wasn't 100% sure what actual call was being used, which is
why I mentioned it, it being the only unmentioned thing as it were.

Well at least if nobody else did, I learnt something, because I didn't
know it was guaranteed to be eight! <G>

The processor probably wasn't in supervisor mode. Try a loop with PEEK
and POKE they *might* shift in and out of user/supervisor mode
accordingly. Just try a single POKE first - no point writing the rest
of the code if it doesn't work. ;-)

There is an absolute address version of the DVI executable file format,
so a file written in that format should be loaded automatically into
any desired address and executed. (I've never actually tried it.)

OTOH, if you replace the system ROM with RAM or Flash RAM, you won't
be able to boot up at all.

This is obviously for loading a TOS, isn't it?

Did you consider using the AUTO_206.PRG loader that comes in TOSPATCH package (to be found on Atari FTP sites, named TP206***.LZH). The package contains provisions for adapting TOS to loading on arbitrary starting address, and I suppose that the loader program can cope with anything that is specified for TOS location. The starting address is contained in the TOS image (in the first ten bytes or so), so a moderately smart loader program should not have any problems dealing with that.

Because you intend to load TOS on the original starting address- $E00000, there is no need to modify it through TOSPATCH, just use the loader- or use TOSPATCH anyway to implement some bug corrections and improvements- there are many prepared in the supplied command files.

>(all in standard ST-RAM), and saved to another file. Even with an improvised
>(i.e. non-optimized) little program compiled with Gfa-basic it took below
>30 seconds. Is it possible that your DTACKing circuit is too slow? If it
>responds several CPU-cycles too late, it may significantly prolong data
>transfer.

I tested it on my STE doing a read from the rom. It does seem awfully
slow, I know. I did this (IIRC)

```
20 for t= 1 to 262144 step 2
30 a%=peek(&HE0000+t)
40 poke &H30000+t,a%
50 next
60 bsave "test",&H30000,262144
```

Well, that was the basic way, there may be a couple of bugs in there. It
takes the ROM, buffers it to ST memory and then saves it.

Henk Robbers has helped me out with a compiled version (the Lattice
version had a problem with the array or something).

Thanks to everyone who helped, if it works OK I'll put all docs on my
website.

Sorry, I forget to reply to this bit. I did download some tools from
Hallvards website as I couldn't find anything under that name you gave. I
got some tools to modify a tos.img reading for putting into EPROM but
didn't see anything for loading it. I've just seen what you mean know,
the sort of program that puts it into ST RAM.

Thanks for that.
Actually it's done now and it works ;-) Besides that I'm using simple - open, read etc. functions (no FILE * stream is used).

Probably somebody else will use it.

I am quite aware what you are trying to do, but read carefully- that's
exactly what I was saying: original TOS image is already set for $E000000.
Then I suggested that maybe the loader program supplied with TOSPATCH
might recognize $E000000 and load TOS there, thus solving your software
problem.

Anyway, using TOSPATCH to hack a little into TOS image might give you some
benefits, like removing bugs, enabling it to format a MS-DOS compatible
floppy, translating the TOS resource files, etc.

>I need a program that can read a file and place it's contents at this
>address range to update the memory. Peek/Poke is very slow, even when
>compiled to max speed. About an hour.

??? I can't understand how you succeeded in making it so slow? I made
a little test- loaded 256KB from a file, poked it all into another location
(all in standard ST-RAM), and saved to another file. Even with an improvised
(i.e. non-optimized) little program compiled with Gfa-basic it took below
30 seconds. Is it possible that your DTACKing circuit is too slow? If it
responds several CPU-cycles too late, it may significantly prolong data
transfer.

cu.

That is not exactly true- with a proper hardware circuit and if adequate precautions are taken against a corrupted TOS image, it would be possible to boot from a previously loaded Flash RAM or a battery-backed SRAM.

Sorry, I should have specified "uninitialized" RAM or Flash RAM,
which is what he would have before he runs the copy program.

As it turns out, he plans to switch from ROM to RAM on the fly.

Hi!

Join the EmuTOS project at:

http://emutos.sourceforge.net/en/index.htm

EmuTOS is a singleuser singletasking operating system for Atari ST
computer emulators. Today it is just running on STonX. But my
intention is to have it running on every Atari ST emulator available.

It is thought as a replacement for the TOS-images you usually need
today on these emulators.

EmuTOS is based on Digital Research's GEMDOS sources, which was made
available under GPL license in 1999 by Caldera, and so is EmuTOS.

EmuTOS today is made up of four parts:

- The BIOS/XBIOS, which provides the interface to the hardware.
- The BDOS, which is what you know as GEMDOS
- The shell command.prg

Maybe it is enough for starting games. Possibly it will get a "full"
TOS with graphics and all. Maybe it will run on real hardware some
day...

The EmuTOS Mailinglist is up and running.
Go here to add yourself to the list:

http://lists.sourceforge.net/lists/listinfo/emutos-devel

and here you can see the archive:

http://www.geocrawler.com/redir-sf.php3?list=emutos-devel

Try http://www.stud.uni-hamburg.de/users/in5y280/tospatch.html

or, for a somewhat older version, which I used

ftp.cs.tu-berlin.de/pub/Atari/Utils/tp206v38.lzh

which is for German tos only. I believe that on some British site
you can find an archive called TOSPATUK which contains files for
a British tos (different routine addresses there).

>
> Thanks in advanve.

I've had a go at writing one in ST Basic, but gave up - it's hopelessly slow on my TT, (5 mins for 256k data, versus 1 second for 512k when done in C) and it was a bit "iffy" as well (probably due to my not using Basic since the 1980s)

I also started writing one in Lattice C, and it seems to be working OK. It puts up a dialog, and allows you to pick the address you want to use from a popup menu (with the two most common addresses predefined), pick the sizes from a menu, a file name via the file selector, and then read/write the file. If you want a custom address or data size (in 1k increments), you can also enter these and select "Custom" from the popup menus.

It seems to be quite reasonable speed wise under SingleTOS (AES 4.1, TOS 3.05), copying my TTs ROM (512k bytes) to a semi-fragmented SCSI hard disc partition in about 1.5 seconds, and reading it back into the ROM space in two seconds or thereabouts. (Not having access to an ST, I'd guess these times would elongate to about 8-10 seconds, which seem quite reasonable)

It's a bit over 500 lines of C source.at present, compiled only for a TT, and the double-clickable APP is about 60k in its incomplete, but fully debuggable form (it'll probably end up nearer to 40k when I've tidied it up, added some more sanity checks [checking if you're writing/reading "bad" addresses and so forth], recompiled for an ST, and removed the debug info from the program)

I can probably email it to you in the next few days.

I'll keep that archived but the actual program is sorted, Henk Robbers has done a grand job with this small TTP. The battery backed SRAM now works but I haven't put actually put a battery on it. I need to mount the GAL onto a piece of veroboard/stripboard and place the battery there. The SRAMs fit nicely into the spare ROM sockets. There is actually no modification to the old ROMs as you desolder the bridge across the CE and solder two wires to either side of it.

I'll write it fully up with schematics etc.

Thanks Djordje.

(Where did you get the address &h30000 from?)

> Well, that was the basic way, there may be a couple of bugs in
there. It
> takes the ROM, buffers it to ST memory and then saves it.

You're reading 16 bit words from an odd address. This will cause the
68000 to complain, (normally generating a three bomb [Address
Exception] crash, but Basic seems to have intercepted this, and runs
slower than normal as a result)

At the first iteration, you're reading (E00000+1) = E00001 (odd
address!)
The next iteration you're reading (E00000+3) = E00003

A better way would've been something like:

```
FOR t% = 0 TO 262142 STEP 2
a% = PEEK_W( &hE00000 + t% )
POKE_W &h30000 + t%, a%
NEXT t%
```

That was &HE00000 in my real basic.

```
>> Well, that was the basic way, there may be a couple of bugs in

```

I also put Step 2 afterwards too, I remember this as the 030 can access odd address IIRC and it was a commen coding problem when the software was run on ST.

Yes, the 68030 can read words and long words from odd addresses,
but it takes twice the time than reading from even addresses, as
it is (IIRC) internally realized by first read a word from the
next lower even address and then the following word, and returning
the intersection of these two words.

Ciao

>but I haven't put actually put a battery on it.

If you haven't already done so, maybe you should make some voltage-monitor
circuit which would positively reset to old TOS in case of battery voltage
dropping below some level. With cmos logic the control circuit would not drain
battery much.

5072. gnu lcomm and bss variables

Newsgroup: comp.sys.atari.programmer
Date: 2001-10-22 13:47:29 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3BD42371.AF1F1A3F@siemens.at>
Source record: 891
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

For one of the projects I am working on I needed a program that
converts code from gnu assembler to devpac assembler syntax.
I wrote a program and checked the differences on the resulting
.o files using TTdigger (great program, Henk, many thanks for
it). ATM the situation is that nearly all produced code is equal.
The main difference is, that gnu .comm variables which I
translated to xdef variables in the bss section should be
translated in some other way, because in one .o file they
are included as 0 and in the other .o file it's 6xxx.
This wouldn't be a problem if the resulting program would work
but it doesn't. BTW, after assembler I called gst2gcc to convert
the .o module and then linked it with other gnu objects.

Many thanks for any idea
Gerhard

5073. ANNOUNCE: Cleveland Free-Net Atari SIG archive

Newsgroup: comp.sys.atari.programmer
Date: 2001-10-25 15:59:30 UTC
From: Kevin Savetz <savetz@northcoast.com>
Message-ID: <savetz-128123.08593025102001@corp-radius.supernews.com>
Source record: 892

I am proud to announce the launch of the Official Cleveland Free-Net Atari SIG Archive.

http://www.atariarchives.org/cfn/

The Cleveland Free-Net, a free dialup and telnet BBS offered through Case Western Reserve University, was home to an active group of Atari users. The Atari SIG (special interest group) had information about every Atari platform, including 8-bit computers, 16/32-bit computers, Jaguar, Lynx, and Portfolio. The Cleveland Free-Net was shut down on September 30, 1999, but before it was, a complete backup of the Atari SIG was made.

Working with the folks who ran the forum, we have endeavored to preserve both the feel of the SIG and the information it contained. This is an amazing resource that exceeds 200 megabytes of data - much of which isn't available elsewhere.

"The Atari SIGOps hoped to preserve this extensive information resource we had built over the years. We approached www.atariarchives.org and Kevin Savetz with the idea of a permanent web archive of our SIG, and we couldn't be happier with the result." --Michael Current, mcurrent@carleton.edu, former 8-bit Atari SIGOp, Cleveland Free-Net Atari SIG.

Among the highlights:

A Time Capsule of Atari news items from 1986 - 1999
http://www.atariarchives.org/cfn/12/03/

Atari 8-Bit Technical Reference Manual and upgrade guides
http://www.atariarchives.org/cfn/12/02/

664 ST-related newsletters, including Z*NET and ST Report
http://www.atariarchives.org/cfn/06/08/

A complete archive of Z*Magazine
http://www.atariarchives.org/cfn/12/05/02/

Reviews of 79 Lynx games
http://www.atariarchives.org/cfn/08/07/

5076. Any attempt at an Atari Revival is IMPOSSIBLE!

Date: 2001-10-29 21:30:17 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <nSjD7.310$oQ2.19078280@news.incc.net>
Source record: 895

Unless...

We regain the Atari brandname. Otherwise, we'd just be porting Atari apps to run under a different processor/OS platform. That doesn't make them Atari apps any more. It makes them X-app running on X-hardware. It's no different than porting any game from the arcade to the Playstation, or WordPerfect from DOS to the Atair ST. The reason those apps were considered Atari ST applications was because they were *unique* to the Atari ST! And, if they weren't, they were usually only ported to or from the Amiga platform.

If the effort to "revive Atari" is to have ANY hope, we must go to the source (Infogrames) and reaquire (by license) the Atari name with reference to a computer/hardware division.

However, we must be resolved to do this. We must see that anything less is utterly a waste of time and pointless. Emulation, for the sake of enjoying the "old ways" just one more time is simply a time-wasting "nostalgia trip". If we are so desirous to get back to the days of Atari's golden age, we must realize that it involves the NAME! An Atari computer is NOT an Atari computer unless it is called an *Atari* computer. And, none of the clones, regardless of their ability to run Atari ST/TT/Falcon030 applications are Atari computers.

And, worst of all, they will all die, if they haven't already.

We are in the last days of "Atari". The fumes the die-hards have been running on are evaporating into nothingness rapidly. Eventually, there will be nothing left and no one to care. And Atari, as a namesake, memory, and gaming pioneer... will be lost forever...

Say what you will, but you must answer me this. WHY do you use an Atari computer and the software that you run on it? Is it the applications? Is it the brandname? Is it the uniqueness of the hardware? Or is it just fond memories that keep you going?

If owning and using an Atari ST computer (or clone) is so important, then why isn't reviving the company that started it? It's not about the people who worked at Atari... they KILLED it, remember? It's not about the designers who made the cases (though I am still very partial to the 1040ST design myself), they've moved on. It's not about the features or limitations of the system. It's about the NAME! The company! The meaning!

An Atari computer isn't an Atari computer unless it's *called* an ATARI computer!

If you say that the name isn't important to you, then why do you use an Atari computer? If you say it's not the applications you care about, then why do you use an Atari computer? If you say it's not the nostalgic memories of having a computer that was ahead of the rest in it's day, then why do you use an Atari computer?

Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that, if "Atari" were to make a comeback, and started manufacturing computers, PDA's, laptops, and more again... that you wouldn't be thrilled?

If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is an issue of pride and trust. Sure, that trust has been marred by the people who owned it before and the name "Atari" is merely being leeched for some game titles by Infogrames. "Atari" hardly means anything but "dead, ancient game company", these days, but when it was first created, it meant "Success!" (I believe that's the correct translation, if memory serves me right).

We can't bring back the past, but we can enjoy the present. I would love to go back to the days when The CareBear demos and STOS and Brattacas and Barbarian and BloodMoney and Shadow of The Beast and Xenon and 1st Word and DBMaster One and NeoChrome and all those other games and programs were around. If I had my druthers, I'd turn back time, stick myself right in the crux of the 1040ST years (there were at least three or four, weren't there?) and put it on an endless loop! I have NEVER been that happy. I've come close, but just when I think I can regain that same state of bliss, it vanishes. Why? Because BeOS is dead. Because Macs are too expensive...

Because nothing, but NOTHING... is the same as owning an Atari 1040ST back in 1986, right after my graduation at Pasadena High School. Do you even realize how excited I was when I saw the first 520ST ad in a magazine? Do you know what my reaction was when I saw my first 1040ST ad?

I remember it like it was yesterday... I owned an Apple IIc at the time.

The instant I was finished drooling over the ad and the features the 1040ST was boasting, I said one thing to myself...

"I'm getting it."

And as soon as I graduationed, I sold my Apple IIc and had my mother drive me to ComSoft in the Sun Valley, CA (I forget exactly where it was, but it wasn't too far from where my friend , James, lived at the time), and I bought one.

[Anyone remember "Logical Choice for Computing" in California?]

And if any one of you have even the tiniest HINT of a cranial concept of these same emotions, you'd realize that the name 'Atari" means almost more than the things they created. Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know what? I'da bought one. I was so proud of my FAVORITE company. I wanted to work for them! I looked forward to going to the computer store to see what new software was released. I bought Joust and Star Raiders as soon as they were released. The list goes on and on...

I also went to every Atari Faire in Glendale, Ca. From the first to the last.

But those days are gone. The games were all so deeply copy-protected and tightly wired in Assembly Language, there's little to no hope of ever getting them ported to new hardware, with or without the Atari name. Psygnosis is dead (or at least I haven't heard anything about them from within Sony in recent years). Those games are dead. STOS is the same way.

The only thing we could do is find the programmers to port any and all possible ST applications to the new hardware. I believe, beyond a shadow of a doubt, that if Atari started making computers again... computers that had an OS that was simple and fun to use, but more powerful than TOS/GEM was, ha d some really nice hardware under the hood, and boasted of "Power Without the Price" again... we'd see the "old ones" coming out of the woodwork. And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't* "leading edge".

Why?

Because it would be... an Atari!

Jared

Jared,

Do you think that you could stop cross-posting to all the atari st newsgroups?
One reading of your posts is quite sufficient.

Thank you for your attention.

I believe that what I have to say is genuinely important enough to make sure that it doesn't get overlooked. I assume that not everyone looks at all the Atari newsgroups, so I consider it possible that my post(s) may be overlooked or never seen.

As well, what I sometimes post in one newsgroup is the exact same reply I would give in the next one, so I duplicate the reply. It's not that I'm trying to be annoying. It's that I want to be sure I am heard.

"If I didn't believe in what I was saying, I wouldn't be saying what I believe in."

> It's not that I'm trying to be annoying.

Really!!!!!!!! you dont give that impression!!!!!!!!!!!!!!

> It's that I want to be sure I am heard.

Like the sound of your voice more like!!!!!!!!.

> "If I didn't believe in what I was saying, I wouldn't be saying what I
believe in."

Look you fucking moron, why don't you get the message, piss off, no-one is interested in you or your ramblings, go jump off a bridge or otherwise do yourself serious physical harm, you've gone as far as you can mentally.

> doit?

The best ?
One way is with:
void v_bar ( int handle, int *pxyarray );
set the color before with:
vsf_color (handle, int color_index );

> I was said that RSC files are involved with that.

You don't need a *.rsc although you can use one.

I don't actually have a very long list of people I cannot stand, but your attitude to this subject and your refusal to accept the wishes of the majority is getting you close to the top of that list, and once you hit the top you get promoted to the "intended of serious harm" list.

I respectfully suggest that "Jared" should be read "jar head"...
This guy is *obcessed* with the Atari name. Everything he sees and
hears reminds him of Atari. IMHO he *needs* professional psychiatric
help!!!

I hate to educate you, but "Jar head" is a term for Marines, I believe. I never have been and never will be one. Attempts to use it to insult me will be considered slanderous to my real name and legal measures will be taken.

Now, if everyone is listening, let me say for the final time.

I DON'T CARE ABOUT THE NAME "ATARI" BY ITSELF! I WANT TO RESTORE WHAT "ATARI" *REPRESENTED* (products) BEFORE THE TRAMIELS SCREWED IT UP!

The fact that the company was named "Atari" is coincidental. It could have just as easily been Kawasaki or Coleco or Namco or Apple!

It's not the name that matters so much, it's the products they made. But you can *not* build new "Atari" computers, if you do not call the company "Atari". Capishe? If I hated Atari's computers, I'd hate Atari. If I hated Apple's computers, I'd hate Apple. But I don't. It's that simple. The name is connective, not intrinsic (I hope I'm using that word correctly).

If we could build Atari-compatibles without the Atari name and restore the entire Atari scene based on the exact same principles I want to use by restoring "Atari" as a company, I would gladly do so. I surely don't want to get things any more complicated than they already are. Licensing the name is added expense and legal issues that I really don't wish to get involved in, but...

If we're to do it right, we HAVE to carry the title with the flag, if you get my point.

You can't call yourself a Christian (title) and count off what it represents (the flag) if you practice Buddism. It's like saying you're a cook when you're really a painter! Some may argue, "Well Christ died 2,000 years ago, so since the name Christian relates to Christ, it's not accurate, because what you represent is dead."

Ah, but He rose again on the third day! And lives forevermore! Just because I can't see Him, doesn't mean I can't believe in Him. And, for proof of His eternal existance... that nice book called the Holy Bible. It's been around for hundreds of years, through catastrophies and attempts to obliterate it... it's still here today. What more proof do I need than that?

It's no different than if the Atari clone efforts *were* still going strong today, in representation of what Atari stood for years ago. But Atari is not Jesus (heaven forbid, even the slightest thought that it ever could even come close!), so people soon realize that, without the one they followed after, it's pointless to follow.

Without the tree, the branches whither. Without "Atari", all efforts to continue in it's footsteps soon fail as well. We tried and struggled to continue on, but the loss is too great. The wound too deep. Without reviving Atari,as a company, no effort in it's footsteps will last much longer.

All I want to do is reverse the loss, so the branches can grow thick and be healthy once again.

Aye, there's the rub! Why don't we ASK what their plans are with Atari? Is it really that complicated?

We stop arguing about what a fool and nostalgic nutcase I am for talking like this and actually plan out what we would do to carry our part of this matter out. If we each got in contact with the Atarians and ex-Atarians we knew or had association with, and hammered out a rough concept of a business plan for "the new Atari", we might actually have something to present Infogrames in a couple months!

We do all we can do on our end and present them with our case. After that, it's up to them.

Just go to: http://www.beunited.com and see for yourself what a bunch of people who BELIEVE IN SAVING SOMETHING can do! They're not arguing that it's a dumb idea, or that it's pointless because Be, Inc. has sold all their IPs to Palm, or that the first guy who spoke up about licensing BeOS was a fool. They've come together, actually spent *money* (out of pocket and from donations) to write up a formal proposal of their request, and SENT it to Palm! Now it's up to Palm, if they will move in our direction or away from it.

But THEY'VE *done* everything THEY *can* do to SAVE BeOS!

Is 'Atari", as a company, any different? No! It's a company asset of someone elses now, that we want to *license* for our own interests! And Infogrames would profit from it just as Palm would profit from BeUnited, if they agree to do so.

I really wish more people here could see the friggin' forest for the trees, man! It's really NOT that difficult! Arrrrgh!

This is off topic, however since you don't grasp that concept I'll reply anyway. Why don't you take a look at the market, perhaps read up on amiga? Amiga has a user base, it still has it's name, and a company and plans... I don't see people chucking PC's for amiga's, nor do I see amiga's at the local dealers yet. I suspect I never will.

Atari seems to be in worse shape. The only way to bring it back would be to sell an Atari that is feature-wise, software-wise, and speed-wise comparable to a PC and at the same price point. Too many obstacles, and people shop for cheap not QUALITY which is painfully obvious.

Hello Lonny,

Actually I have encountered some PC owners that have switched to Atari computers, but most of them were MIDI users. Let's face it, Atari computers are still number one when it comes to MIDI. I do not think we will ever see Atari computers in the retail stores again. I am satisfied just to be able to get them through the mail. I do not think we will ever need an Atari computer to be exactly the same as a PC when it comes to speed. Today's Atari programs do not need that much speed. Remember this, take away the Internet & games and a Pentium II CPU would do everything else just fine (with some graphic exceptions). Basically, our Hades computers are very much comparable to the PC's. We just need alittle more speed and some software drivers. True, no USB port... Take care...

Hi everyone.

I'm looking for owners of Prospero software products (e.g. Prospero C, Prospero Pascal etc.). I recently contacted Prospero and asked them if they would let me distribute their old ST programs on my website for free. Unfortunately I don't have any Prospero programs anymore. If you own a Prospero product please contact me.

Thanks,
Matthias

>computer and the software that you run on it? Is it the applications? Is
>it the brandname? Is it the uniqueness of the hardware? Or is it just fond
>memories that keep you going?

First, I miss the days before most computer manuals contained the words "morons" or "complete idiots" in the title. When printers came with sufficient documentation to allow you to write your own driver, rather than a Windows driver and instructions on clearing jammed paper (in PDF or course) on CD. I miss Fidonet and Genie.

I resent the success of PCs. It's not that they are bad computers, but they certainly did not deserve 95% of the market. OTOH, selling computers to people who know nothing about computers was always IBM's specialty. Also, the vast majority of current computer users WANT a monopoly so they don't have to learn more than one way of doing things.

I resent the success of UNIX. I have been programming on mainframes since the late sixties, and UNIX is worse than any of the OSes I'd previously used. Its sole virtue is that provides all of the basic functions of a multiuser OS (albeit poorly) and is cheap. Its worst aspect is that so many college students were first exposed to computers running UNIX that they regard UNIX as the ideal toward which other OSes should aspire, rather than as a collection of badly documented and unorganized kludges.

I resent many obnoxious trends in computer science. "Since most programmers get into trouble when they attempt 'X', we do not allow them to do 'X' at all." Fad computer languages or programming styles which are supposed to eliminate bad code but never do. OSes which severely restrict the range of what is possible on a computer. (For example, Macs only allow PC relative and A register indirect addressing.)

I am waiting for a new computer that can honestly be regarded as an improvement over my TT. I am still waiting.

You forget... it was a COMMODORE Amiga. Not just an Amiga. Commodore is dead. It would be like trying to start a company called ST or 1040ST to sell old Atari computers/clones under. That's virtually meaningless as well as rediculous. People have so associated to the model "Amiga", that they forget who made them... Commodore!

"Amiga" was a product name, not a company brandname (ok, at one time it was (joystick manufacturer for the 2600VCS or something?), but still...). People bought up the model name and tried to start a business with it. Kinda worked, but not well. To this day, the business flounders because no specific focus was ever retained.

They did improve the AmigaOS (workbench?) a notch or two (for older systems), but not the computers. They went (or are going) in a decidedly PC/Set-top box direction, as far as I can tell and the userbase isn't happy about it. Everything the Amiga was, under Commodore, is dying off.

I wouldn't let that happen with Atari. Backwards compatibility counts. Familiarity counts. Support counts. Forward technology counts. "Atari' counts.

Did you forget the Atarians that would know of this computer and might well look into buying one also, or are you operating with "PC Blinders" on and can't see that if a new Atari computer, that was a LEAST a 603e-based machine (which is possibly a tad more powerful than a 68060; based on it's RISC architecture), had backwards compatibility (via emulation), significant amounts of memory (64-128Mb), a nice, high-end graphics subsystem (nForce anyone?) and audio (nForce anyone?), etc. and was priced around $1,000.00 or so, that it might attract them like flies to rotting meat (I think more

flies would gather to rotting meat than bees to flowers or honey, hence why I used that analogy)

You are still stuck on the "name" issue. I have a Hades and socked down some serious cash for it, the name, label, model whatever makes no difference. It runs my Atari software well so I bought it.
The only thing needed from Infogrames is permission to adapt the TOS ROMs and or code needed to make a clone. Negotiating over a 5 letter word is utter stupidity, and a waste of money. It would have no bearing on the quality or who would buy it, take a poll and find out.

I don't have a PC. It might sell, but who's going to manufacture it? You?

If more people would of bought the current crop of clones the costs could of come down, and further dev might of took place. Such a machine could have been out already. You sure do alot of preaching for someone who never spent much on Atari hardware.

Coming straight out and asking Infogrames what their "business plan" for Atari is may help to see where they stand with the brandname, but if we are to move them to actually license it to us and allow us to recreate the company, to make a product or products, we need to work together to decide what we would sell, how much it would cost to manufacturer, how many people are interested in even buying anything with the Atari brandname on it, etc.

If they know what we're trying to do right off the bat, before we actually have a decent "gameplan", it probably won't work, especially if they aren't interested in doing anything similar to what we want to do. Of course, at this present time, the "we" I speak of seems to consist of perhaps four people, myself included.

It must be a MUCH larger group with a decent gameplan, if it's to succeed.

I refer, again, to: http://www.beunited.com

... again to show what THEY'VE *done* to get what THEY *want*.

Atari is no different... only people's perception of it is.

In other words, if we can't find out how many would be willing to buy a product from Atari again, we're "flying blind" as it were. For companies that have millions in start-up capital, that's fine, but we won't have that.

90% of it is confidence in what we're doing and the other 10% is customer input. After that, it switches to 90% customer input and 10% company opinion. If we run the company like it's been run, we will most certainly fail. We have to realize that the customer comes first. We make a product they want and they will buy it. But if we make a product, expecting them to buy it just because we built it, we are doomed, sooner or later.

Atari wasn't a bad company... the people who ran it were bad managers of the company. Put the right people inside and Atari will be brought to the position it SHOULD have had years ago in computing history.

It's a shame it was never done before... but companies like Atari and Be, Inc. thought they knew better than the consumer and thus died because of it. I wouldn't let that happen.

I have my own views on what I would want to sell and what it should look like and how it should function initially, but if I let that dictate what we sold, year after year, we'd be no better than Atari was and probably fail just as quickly, if not sooner.

Jared

I admire your views. But I think the Falcon030 was, in part, superior to the TT030. It had more "multimedia" features, though it was slower CPU-wise. Tough call. :-)

And, to the person who said that, because the Falcon030 was housed in the same type case as the Atari 1040ST, people didn't buy it thinking it was no better than the 1040ST(e), assume that no one looks beyond the cover of a book to find out how the story ends! If people are THAT stupid, they didn't DESERVE to own an Atari computer! All someone had to do is look at the *specs* to see how much better it was than others before it, 1040ST-styled case or not!

It's actually really simple, when doing any VDI drawing, call graf_mouse()
to hide the mouse, make the VDI calls, then call graf_mouse() once again to
turn the mouse back on again. You need to have matched sets, off then
on again, any deviation from this results in the effect you see, commonly
refered to as mouse droppings. ;)

Far as I know when making AES calls you do not have to mess with the mouse.
Perhaps someone wishes to add to this?

Who said anything about bringing back the original staff? Gee, are you
truely an imbecile? Have you not been listening to ANYTHING I've been
saying all these days? It would be stocked with Atari enthusiasts (like
you) who know what we want and would be willing to give what our customers
want.

Sometimes I think you assume that I so love "Atari" that I want the original
people who ran it as well... and that would truely be the most stupidest,
idiotic thing ANYONE could imagine to do. And... no... I would NOT do that!

>Did I mention that you are seriously annoying and your presence is unwanted
>in this base, nay this universe.

I think a time or two you might have made mention of it in some way or
another. :-)

The Falcon was (it's sad to say), rather badly designed. There wasn't
enough effort put into the design & tuning of the hardware, and the
firmware (at the device driver level) wasn't to hot either.

I loved my f030, but it wasn't until I'd spent money on lot's of after
market stuff for it that it became a really useful machine (Nemesis for a
faster bus, AT keyboard interface, new case, etc).

The TT, on the other hand, was useful out of the box. But both were vastly
overpriced (my f030 was one of the original UK developer machines, and set
me back ï¿½1000 or there abouts at the time). Just like current Atari
(compatible) machines are vastly overpriced.
These days I could put together a $100 set-top box that'd run Atari
software perfectly well (emulate the 68K on a 120MIPS R3K core, stick a
second R3K core on the chip to run the underlying stuff). And that's
including ethernet, modem, TV + SVGA output, video input, and an infrared
keyboard/mouse combo. The reason no one bothers, is there is no market.

I had troubles for years to understand strange behaviors of symlinks with MagiCMac, but this time I had to change the hard disk and did some tests and reorganization of the system. My main problem was about links copied from and to atari scsi formatted partitions and macos folders, the german documentation didn't help me too much but the result is this:

links on Atari partitions are "real magic" symlinks, where on MacOs folders seen under MagiCMac MacOs aliases are used instead. The fact is that MagiCMac do not about the difference when copying links from one kind of filesystem to the other, so in the end:

- a symlink in the Atari filesystem pointing to an object on a Mac filesystem does not work
- an alias on a Mac filesystem pointing to an object on the Atari filesystem does not work

For these reasons, when coping symlinks and aliases from one filesystem to the other, the copy does not work.

I went deeper and asked myself "why sould it not work ?", when you create the link in those cases, you can still see the correct Atari path memorized in the link infos, what goes wrong, it that the Mac filesystem cannot access the Atari filesystem directly, so an alias does not work, the other problem is that the Mac alias records the Mac path like :Diskname:foldername:filename

So what ? Yes I did a small program, that reads the symlink infos, renames the link to *.bak and creates a new (working) link with those infos so that the correct alias is created, I used the program to convert all aliases I had on Atari partitions, when moving all the files on an HFS Mac disk. In fact I wanted to let the Atari partitioning go, and stay with the HFS to be able to use Disk utilities for my files. I made some tests to check all was going correctly first and tested the performance. On HFS the speed is a little bit slower due to the double job of simulating one filesystem on another, but I had big advantages:

- network file sharing on all files
- hard disk utilities for correction, recover, optimization
- backups
- access to Atari files with Mac programs

Back to the program, I place it here, should be easy to read, and let me know if you want to discuss:

```
#include <mintbind.h>
#include <tos.h>
#include "magx.h"
#include "mgx_xfs.h"
```

```
void main()
{
// Pdomain( PDOM_TOS /* 0 */ );
Pdomain( PDOM_MINT /* 1 */ );
{
XATTR xattr;
long dirhandle;
LONG err,xr;
long rename_error=0;

dirhandle = Dopendir(".", DOPEN_NORMAL /* 0 */ );
if (dirhandle >= 0)
{
char buf[128]="pippo";
char buf1[128]="puppo";
char buf2[128]="peppo";
do {
// printf("%s\n",buf);
// err = Dreaddir(128, dirhandle, buf);
err = Dxreaddir(128, dirhandle, buf, &xattr, &xr);
if (xr)
printf(".. Fehler bei Fxattr: %d ..\n",xr);
if (err)
{
if(err!=-49) /* if not end of reading */
printf(".. Fehler bei Dreaddir: %ld ..\n",err);
}
else
{
//--->file printf("%s,%u\n",&buf[4],xattr.attr);
// printf("***%c%c%c%c***\n",buf[0],buf[1],buf[2],buf[3]);
// printf("%u,%u,%u,%u,%u,%u,%u,%u,%u,%u\n",
// buf[0],buf[1],buf[2],buf[3],buf[4],
// buf[5],buf[6],buf[7],buf[8],buf[9]);
// printf("%lu %lu %lu\n",buf,xattr,xr);
if ((xattr.mode & S_IFMT) == S_IFLNK)
{
XATTR xa2;

// printf("SymLink found %s,%u\n",&buf[4],xattr.attr);
err = Fxattr(0, &buf[4], &xa2); /* mode 0 reads xattr of actual file */
// err = Fxattr(1, &buf[4], &xa2); /* mode 1 xattr od symlink itself */
if (!err)
xattr = xa2;
else
{
printf("ERR ");
sprintf(buf2,"%s.bak",&buf[4]);
rename_error=Frename(0,&buf[4],buf2);
if(rename_error)
printf("ERR:%lu,%s\n",rename_error,&buf[4]);
else
```

```
{
err=Freadlink(sizeof(buf1), buf1, buf2 );
printf("%d,%s,%s,%u\n",err,buf1,buf2,xattr.attr);
err=Fsymlink(buf1, &buf[4]);
}
}
err = 0;
}
}
}while(!err);
Dclosedir(dirhandle);
}
}
}
```

> Should this be understood as that you obtained their permission?
>

I have now copies of the three programs and I'm in contact with one of their executives. It's now mainly a matter of writing the right disclaimer and distribution conditions. To answer your question: no, I haven't got the final permission from them and I will not make them available until they give me their ok.

> Btw. which were the latest versions of their FORTRAN, Pascal and C?

I know that Fortran was at 2.1. I forgot about the other ones. But they look quite modern despite their age.

> Also, I came once upon a reference on "Prospero Developer's Toolkit";
> what was that supposed to be?

I don't know.

Finally got my site up. I had to rush a bit to meet a dead line so I only put up the graphics mode outline in the BASIC tutorials section.

http://www.sheridanc.on.ca/~ruminski/enterance.html

I should have about 8 more reviews up within a week or so after I get chance to capture more games on video. Warning to all Netscape 4 users that I dosn't work in Nav 4 but it will work in Nav 6 (good enough reason to upgrade to 6 :)

I just got in 5 extra PCs with 51/4 floppys so as soon as I get one out of them working I will begin extracting code (first to be extracted will be mountain king)

Oh, yeah, right... kick 'em when they're down. Real nice of you, Ken.
Yours is the kind of attitude I've been having to deal with over at the
other Atari newsgroups for my efforts. At least he's trying! He's trying
to contribute to the Atari scene and you just berate him for not doing it as
good as you're used to. He did say he had to rush things a bit, didn't he?
What if he decides to just give up after hearing your "words of
encouragement"? How would you feel, then?

sigh The conflict of those within the castle walls...

>empty? what browser are you using??

Without Javascript the entrance page is empty in Netscape 4.75. Lynx
also displays an almost blank page, except for the embedded shock wave
file. !Arcweb, a RISCOS browser, also fails to get anywhere. This
implies, since I can't test it, that neither would CAB.

>everyone that i know has seen the site and its fine..

Probably because they browse with Javascript enabled. Not everyone does,
and CAB doesn't support it at all.

IE6, NN4.75 and NN6.1 all display the page correctly if Javascript is
enabled.

It may be a good idea to add a link for those that don't, or can't, use
Javascript, as well as a <NOFRAMES></NOFRAMES> part for those that are
still using a frames-incapable browser, e.g. CAB 1.5.

A web page that needs

1. Javascript enabled to display anything at all.

2. ActiveX plugins/scripts enabled for navigating

is poorly written. This is even more true as the actual content is
nothing but standard text and pictures.

I guess it could be compared to writning programs that make direct
hardware calls instead of using proper OS calls for compatibility.

In an Atari newsgroup you are very likely to find people who browse
without any scriping (CAB). They will not be happy when all they get is a
blank window.

(A note to MSIE users with versions prior to 5.5 SP2: Do not browse with
ActiveX scripting enabled. You are vunerable to the NIMDA worm simply by
visiting infected IIS web servers.)

>was gonna feel bad but then I saw the abysmal code on your page. I truly
>hope that you didn't write that....for a page with just basic formating and

It displays properly on virtually any browser AFAIK. Apart from the 8bit
charcters in the Swedish texts I'm not aware of any specific errors.

If there is anything you can't access, feel free to mail me and I will
try to correct the code.

<deep breath>

There's absolutely NO POINT AT ALL in having an Atari-supporting web site that
WON'T DISPLAY IN AN ATARI BROWSER!!!

Sorry for commenting to your message David.

Derryck,

When a Web Browser is made for the 8bit line of Atari Computers then Ill agree with you. At this time a majority looking at 8bit pages are using a NON Atari computer.

I designed the site for absolute begginers and new comers to classic Atari.
I dont know about you but how many people do think that are new to atari
would be using an Atari browser??

if I made it for the atari browser then the content would have been usless
as anyone using it would already know basic atari programming (and then I
would have a site that also looks like some crappy dreamweaver throwup), i
wanted it to be very presentable and welcomming to new comers.

That's a very common problem today. Very stylish pages that take
ages to load (even PC users sometimes still have analog modems)
and then you see that it was worth neither the time nor the money
it cost. I prefer 'crappy looking' text only pages with some
interesting content anytime and I doubt that anybody that sees
stylish modern graphics and sounds as a necessity will be interested
in the old 8Bit machines.

And totally unrepresentative of the Atari world. Why don't you put your
efforts to good use on a PC oriented site somewhere, you're certainly not
promoting Atari as-is.

Hi

| When a Web Browser is made for the 8bit line of Atari Computers then Ill agree
| with you. At this time a majority looking at 8bit pages are using a NON Atari
| computer.

I think you'll find that there is such a thing, I read of it quite some while back, so since that was your requirement you can now down-date your site.

First its not my site. And second the browsers for the 8 bit are text browsers. Yes, this includes ICE and PHOENIX. And PHOENIX seems to have been around since 1999 but, I havent seen it available for use. When a 8bit browser comes out that can display nice graphics let me know. It will never happen. All there ever will be for the 8 bit is TEXT browsers.

errr, why exactly?
i suppose don't approve of sites about ZX81 computers because they can't
be viewed on old Spectrums ?
I do the majority of my web browsing at work, where surprisingly, we
don't use Atari computers. I also suspect that the majority of people
interested in 8-bit Atari's also use a PC as their main internet point
of access.

Most of the Atari users I know don't have access to a PC and do their
browsing on an ST using CAB.

And because a "suspected" majority use a PC to access the net means
those that don't should be excluded? And what about those who do access
the net with a works PC but can't use Javascript as the employers policy
is to not allow any Java or scripting? They are also excluded.

now on that point i agree, but my original point was that a site that
only works on certain PC's isn't useless or without worth, but would in
fact be accessible to quite a few people who happen to use PC's as well
as Atari's. Also, considering the site in question is devoted to 8bit
Atari's the core market of owners will either have net access via a PC
or none at all, so you can see the site authors point of view that if he
intends people on a pc to view the site, then he might as well make it
look good.

intention is to write a litte /AUTO/ PRG that configures itself
by means of its name, like the old RAM-Disks-PRGs.

not using C and it's argv/argc.
in assembler i was just reading sth about the ENV_pointer in the
TPA and the CMD_line, my 1st quick tries with PURE C gave indifferent
results for that:

the debugger set an empty PATH= variable that wasnt set by TOS2.06.
the C version did not show any program-name in argv[0] like under unix
either.

i think to remember that i did this some years ago.
any hints please ?

If you want to know how to do it in assembler, then the quickest
way is perhaps to disassemble one of these old RAM-disk-PRGs. I
remember one of them is approximately 500 bytes long. Should't
be too long to understand what it does !

Laurent.

iirc there's lots of discrepancies with both the environment and
argv[0] depending on the TOS version.

>any hints please ?

FsFirst/FsNext with a suitable pattern - not wonderful I agree :-|

(also iirc) I recall the current working directory isn't always
predicatable either - you may find that prepending "/auto/" to the
pattern is necessary.

Where would one find software to program the Falcons DSP?

I can recall there used to be an assembler to do so, but cannot recall much about it.

(I'm just curious about the DSP. I don't own a Falcon - I do have a TT though. And a "gentlemans agreement" with a Falcon owner regarding use of their machine)

--

Download the latest DLL manager for the Atari ST. Visit my web page at http://www.atari.net.nz/gem and download the Toolbox today!

There should be tools at http://www.dhs.nu. You could get Devpac DSP or
Motorolas assembler. I've heard DSP programming is very difficult!

I bought Devpac DSP back in the day - I'm afraid it sucks really badly.
It's nothing like the quality of the Devpac 68K assemblers - really buggy :(

I'd reckomend you use the motorola or GNU DSP assemblers instead...

Laters,
Craig.

What do you mean by buggy?

Does the assembler/emvironment crash easily/frequently?

Or does it just generate a wierd/inaccurate binary?

> I'd reckomend you use the motorola or GNU DSP assemblers instead...

Thanks for the feedback. I'll look into them.

The assembler didn't support all the op-codes you'd expect, and the debugger was a serious piece of cack - unusable really. I was very disappointed in it, as Devpac 68K was probably the best assembler for the Atari - and it's debugger was pretty good as well, although I did start using the Black Scorpion falcon-only debugger towards the end (an improvement over the Devpac68k debugger in several ways).

I think it had an error for the JMI instruction, which turned out to
some other Jcc instruction in the binary. It took a while to find out
what was wrong with the program. After that, I've only used Motorola's
assembler.

Tomas

Sounds like it would be better to throw away my DevPac DSP before I
ever used it. Pity since I bought it mainly because I quite liked
DevPac 3.10. BTW, could you tell me what's better at the Black Scorpion
debugger and if the difference is worth the extra money if BSdebug is
still available.

I cann't honestly remember - I haven't used my Falcon in 3 years or more.
I just remember thinking "gee - must buy this" when I saw it at an Atari
show in London, along with a PC keyboard interface, accellerator, NVDI4 and
some virtual memory driver (cann't remember the name, but it wasn't very
reliable).

I tried using the BS debugger for a while, but found it much worse than
DevPac's Mon. Sure, on the surface it is compatible, but none of the neat
features of Mon are in there. The mouse/window stuff in BS could have
been useful, but it isn't used for anything worthwhile and only gets in
the way.

All IMHO, of course.

As soon as I got hold of a version of Mon patched to deal with the '040,
I went back, and I haven't started the BS debugger once since then.

You also could use one of the not so bad free Atari eulators on Mac and do some work with us on EmuTOS, an OpenSource TOS replacement, which now does support most of the BIOS/XBIOS/GEMDOS features of TOS (no GEM). It will (not so much later) work with MiNT (does now!), fVDI and XaAES to give a full graphicle system.

I nthe moment we plan to implement a native execution interface for emulators - mostly in cooperation with the Aranym (Atari running on any platform) folks. Wouldn't you like to help porting Aranym to Mac? This really would be a cool thing. It still does run on Windows.

Have a look at:

http://emutos.sourceforge.net

5151. C in GFA?

Newsgroup: comp.sys.atari.programmer
Date: 2001-12-16 21:59:03 UTC
From: Matthias Jaap <mjaap@t-online.de>
Message-ID: <9vj5bo$be6$00$1@news.t-online.com>
Source record: 970

Hi all,

does someone have a working example of a GFA-Basic program which uses a subroutine written in C? So far I've only seen an Assembler one. The example doesn't have to do much - just printing out "Hello World" would be ok :-).

Greetings,
Matthias

Hi Johan - 's been a long time :)

Of course, I then wrote my own debugger that ran as a MiNT process, and
that was more useful still ;)

(never released the GUI version, but it was a C source level debugger for
Lattice C - one day I'll get my f030 out of the attic and finish it)

Source record: 973

Hello all!

We are pleased to announce the HighWire Development Project web site.

URL: http://highwire.atari-users.net

While NO DOWNLOADS are available at this time. There are some screen shots and other info available for those interested. Downloads will be available shortly. This is a chance for non programmers to get an idea of how development is progressing and to book mark the site before the initial release announcements are made.

HighWire is a New Atari Browser that is UNDER development. We are asking anyone interested in helping code HighWire, in C, to join the group. We are also looking for people experienced in translation and documentation, so that the project can be available to as many Atari users as possible. Without any hurdles due to language problems or documentation.

Please visit the developer section of the site for information on how to join the list.

HighWire Development Project

Why take a taxi... When you can fly!

m> really would be a cool thing. It still does run on Windows.

I had a look and it is interesting, but I have little free time and already
joined the HighWire development team, as I am interested in the web browsing
from my Atari GEM NOS. I do not think it would be a good idea to join another
group, I already have too many things to do.

Just one question, the only thing I would need in MagiCMac would be a way to
use all the serial ports, eventually USB ports (modem/router) and ethernet.

NOS has its own tcp/ip stack but on MagiCMac can use the only serial port
available and this is a limit I would like to jump, if you can put together
an emulator where I can drive more serial and network adapters it would be
really good, expecially as NOS has its own multitasking and all needed
clients and servers.

Could someone give me a hand with a checksum calculation for GFA Basic?
I've taken the code from a C source, and tried to compile it with Borland
with no luck. I want to use the code in GFA anyway, but I'm not sure how to
translate some of the commands.

I would read a file into an array patchData(i%)

UBYTE sum --- what is UBYTE in GFA?

sum = 0
FOR i%=0 TO 4096
sum = (sum + patchData(i%)) MOD (1 << 8)
NEXT i% ^^this means a bitwise shift left
SHL|(1,8)?????

return((UBYTE)((1 << 8) - sum))

Thanks in advance!

unsigned byte, meaning 0 to 255
some compilers allow a signed byte ranging from -127 to 128

> sum = 0
> FOR i%=0 TO 4096

I am pretty sure that is a bitwise left shift, it would appear you converted
it correctly to me, however it's been ages since I ported any 'C'.
Perhaps someone into 'C' could futher clearify...

I assume that it is a synonym for "unsigned char"

>
> unsigned byte, meaning 0 to 255
> some compilers allow a signed byte ranging from -127 to 128

128 is not a valid signed character value - bit 7 would be 'on',
meaning 'negative', and being interpreted as -128.

unsigned bytes range from 0..255
signed bytes range from -128..0..127

> > sum = 0

Why didn't you simply replace it with the value 256 instead of "1<<8"
?

Perhaps if the original C code was posted, we could recode it in BASIC
a bit better.

(I haven't seen/used GFA, however, but it should be similar to other
BASICs WRT code algorithms)

Message-ID: <a1bj72$pj9$1@news.seed.net.tw>
Source record: 983

OK Here is the original C code:

```
UBYTE MakeChecksum(patchData)
/* Given your array of patch data, compute and return the checksum. */
UBYTE patchData[];
{
UBYTE sum;
int i;

sum = 0;
for (i=0; i<DX_FILESIZE; i++)
sum = (sum + patchData[i]) % (1 << 8);
return((UBYTE)((1 << 8) - sum));
}
```

I've tried to convert it to GFA as follows:

```
sum = 0
FOR i%=0 TO 4096
sum = (sum + patchData(i%)) MOD (SHL|sum,8)
NEXT i%
```

...but I get a syntax error.

Any suggestions would be appreciated.

This bit of code is code is summing all bytes of the the data, while
throwing out
all but the bottom 8 bits of data after each accumulation. The (1 << 8) is
simply
256. You could accomplish the same thing in C by replacing the "% (1 << 8)"
with "& 0xff" or "& 255". In reality, on all systems that I have ever
worked with,
the modulus shouldn't be necessary, as a true UBYTE (unsigned char) can only
store the bottom 8 bits anyway.

> return((UBYTE)((1 << 8) - sum));
The function then returns the bottom 8 bits of the above determined sum
value
subtracted from 256
> }
>
> I've tried to convert it to GFA as follows:
>
> sum = 0
> FOR i%=0 TO 4096
> sum = (sum + patchData(i%)) MOD (SHL|sum,8)
I never worked much with GFA but you should be able to replace your
"MOD (SHL|sum,8)" with "MOD 256". Does GFA have a binary AND
operator? If so, you could use "AND 255".

> NEXT i%

Once you get this far, you would need the final operation:
sum = (256 - sum) MOD 256

>
> ...but I get a syntax error.
Does it tell you the location of the syntax error?

>
> Any suggestions would be appreciated.
I don't rember if GFA has typed data such as UBYTE or "unsigned char", but,
if you are consistent in you MOD's (or AND's) your result should be correct.
>
>

A C compiler doesn't know what UBYTE is either - it will have to be
told. The sensible assumption is UBYTE stands for UnsignedBYTE.
Theoretically you need to declare something in GFA which is one byte
in size and that is also treated as unsigned. Incidentally, the most
likely definition for UBYTE for the C compiler is...

typedef unsigned char UBYTE;

...you might have that somewhere. Possibly not though (it is equally
likely to be defined separate to the C source).

> sum = 0
> FOR i%=0 TO 4096
> sum = (sum + patchData(i%)) MOD (1 << 8)
> NEXT i% ^^this means a bitwise shift left
> SHL|(1,8)?????

If SHL yields 256 then yes. (1<<8) is the same as writing 256.

>return((UBYTE)((1 << 8) - sum))

This is (loosely) "256 - sum" truncated to a byte. I do not know the
mechanics of how GFA works an expression: trouble may be
forthcoming...

A C compiler will silently promote smaller datatypes so that they
match larger ones in an expression. Whilst 'sum' might be a byte the
literal values '1' and '8' are "int" therefore 'sum' gets turned into
an 'int'. The expression is really...

```
return ( (int)1 << (int)8 ) - (int)sum
```

...and the (UBYTE) stuck on the front is there to shut the compiler up (it will be moaning about loss of precision when that 'int' gets truncated to a byte).

Consequently...

```
> sum = (sum + patchData(i%)) MOD (1 << 8)
```

...may not work should GFA actually do all its calculations using a byte.

Here's one I liberated many years ago from (Atari) source. It somehow found its way into my windoze library and obviously somewhere along the line got some C++ treatment. I'll explain it which may help you translate yours.

```
uint32 FC
CheckSum(
uint32 curval,
const void * const bp,
uint32 n
)
{uint32 v (curval);
const uint8 * p (static_cast<const uint8*>(bp));
uint32 i;

for (i = 0; i < n; i += 1)
v = v + ( uint32(*p++) ^ uint32(543UL) )
;
return v;
}
```

The 'bp' argument is just a pointer into a block of memory. It is this block of memory that is being checksum'd. The 'n' argument states how many bytes long that block of memory 'bp' is. The first argument 'curval' is usually zero. It exists just case you want to calculate the checksum in lots of little chunks by making the CheckSum() call multiple times - we'll ignore it.

'uint32' is an unsigned 32 bit integer. 'uint8' is exactly the same as UBYTE - an unsigned byte.

The first two lines...

```
{uint32 v (curval);
const uint8 * p (static_cast<const uint8*>(bp));
```

...for all the junk simply say...

```
v = curval
p = bp
```

...so 'v' is our "running total" and 'p' is the address of the memory location whose byte we about to process. The "for" loop needs no

explanation, it just goes through 'n' bytes starting with at location 'p'. The important line does a lot of work when the subtle stuff is taken into account...

```
v = v + ( uint32(*p++) ^ uint32(543UL) )
```

First off, it reads the byte (*p) then it makes p point to the next byte in memory (*p++). This byte is unsigned but is immediately turned into an unsigned 32 bit value (uint32(*p++)). This intermediate value is saved for a moment whilst the second half is looked at. "543UL" is just 543 stored as an unsigned 32 bit "long" - take this to mean (uint32(543)). This value is then exclusive-or'd (XOR) with the intermediate value (uint32(*p++) ^ uint32(543UL)). The result (still a 32 bit unsigned value) is then added to 'v'.

Incidentally, when it matters I happen to be quite explicit over my "casts". That troublesome line could equally appear as...

```
v += (*p++ ^ 543UL);
```

In pseudo-code...

```
FUNCTION CheckSum(curval,bp,n) RETURNS uint32
uint32 v =curval;
uint8 p =bp; //array bp[0..n-1]
uint32 mask =543;
uint32 temp;
uint32 i;

FOR i = 0 TO n-1 INCREMENT i BY 1
temp = p[i]
temp = temp XOR mask
v = v + temp
ENDFOR
RETURN v
```

Oh, and I just remembered where I purloined the original code from! A utility called "Splitter".

5168. Re: Checksum calculation

Newsgroup: comp.sys.atari.programmer
Date: 2002-01-07 14:56:49 UTC
From: Rosco <ckrosco@s33d.n3t.tw>
Message-ID: <a1cd2iifn1@news.seed.net.tw>
Source record: 987

Thanks for all the replies. I've got the code now so that there aren't any errors, but it's not giving me the results that I want. I think the problem is that there is no equivelent to UBYTE in GFA Basic.

Here is my code:

```
OPEN "I",#1,"E:\KCSOMEGA\4OPDELUX\FOUROPVC\1.DXX"
'
sum%=0
FOR i=0 TO 4095
sum%=sum%+INP(#1) AND 255
NEXT i
' RETURN UBYTE (( 1 << 8 ) - sum)
'
PRINT 256-sum%
```

I've tried "sum" as a byte, a word, and an integer. Byte and word values are out of range.

Some info: this is a checksum used by a MIDI synthesizer. I've got some data patches in sysex format with the header and tail stripped off. In order to use the patches I have to calculate the checksum of the data and insert it at the end of the file, as well as restoring the header. I've got no problem restoring the header and the tail but I don't know how to do the checksum. I found this checksum code in C on the internet with comments from various people that it worked. I tried to compile the code using Borland C++ but there were many compiler errors and I don't know anything about C. I've seen this checksum described as "2nd complement (-sum & 127)". On this particular file I know what the checksum should be, and I haven't found any checksum routines that give me what I'm looking for.

I don't recall enough to be sure, but I suspect you might want to do

sum%=(sum%+INP(#1)) AND 255

instead.

You can define a byte as var|, the vertical bar denotes a byte in gfa.

You also will get different results compiled versus not compiled as compiled
code ignores overflow. If this 'C' code relies on the fact that overflow
is ignored you will have to test it compiled perhaps.

In editor:
b|=255
b|=b|+1 will halt with some error
Compiled however the byte value will simply wrap around to 1 or some value
you don't expect and no error will appear. I have seen programs in the past
rely on such things.

Also you can use value|=BYTE(sum%) for example to fetch just the lower 8
bits of a long or a word.

Dunno if any of this helps.

Thanks to everyone who replied. Guy, I appreciate your thoroughness, even though it's way over my head.

My main problem was that I don't understand the math involved in these bit manipulations. There turns out to to be a method that even I can understand : add up all the data and then subtract 128 repeatedly until the result is less than 128. Then subtract that number from 128.

This may not be very elegant or efficient but it does the job and I can understand what's going on.

```
OPEN "I",#1,"E:\KCSOMEGA\4OPDELUX\FOUROPVC\1.DXX"
'
sum%=0
FOR i=0 TO 4095
sum%=sum%+INP(#1)
NEXT i
'
DO UNTIL sum%<128
sum%=sum%-128
LOOP
'
RETURN 128-sum%
```

```

Ah, obfusticated code in reverse! All it does is add the byte patchData[i] to the byte held by sum. ie sum+=patchData[i]. Nothing more.

>return((UBYTE)((1 << 8) - sum));

Ditto. "return -sum";

>}
>
>I've tried to convert it to GFA as follows:
>

>
>Any suggestions would be appreciated.

I see it stated elsewhere that GFA has no datatype that can hold an unsigned byte. No matter use declare 'sum' as an integer. You may be able to dispense with some of the AND's but I'll be explicit...

sum = ((sum AND 255) + (patchData[i] AND 255)) AND 255

return (-sum) AND 255

Eg: If you were to make DX_FILESIZE=2 to handle two bytes of data, and those bytes were $01,$02 then you ought to get $FD back from it.

Incidentally, the C code is really old. A modern compiler would struggle, even with UBYTE defined, unless it had a K&R backwards compatibility option.

Hi all,
I'm looking for someone who can disassemble, alter and then reassemble a program for me. What I want is to remove several fixed values from within the program to a file and have the program load them from there as this will allow me to change the values as required.

So anyone want to give this a try?.

Stephen Moss

P.S. The program was written for the ST.

The tool you need is Henk's TT-Digger or Easyrider. I'm only running ST in
emulation ATM and don't have all the right kit on this Bill-Box otherwise
I'd offer to have a go myself.

How large a program is it? Adding new code may well make it very
complicated to achieve. A simpler solution may be to check out the
offsets of these values, and fix a program to change these in the
binary, to allow easy modification of the values.

Anyway, I can have a go at it, if I can find a disk with Bugaboo and
my systems still works.

HTH.

```
In uno strano messaggio del 17 Jan 02 lafabrie@club-internet.fr (2:333/608.1)
scrisse al povero All :
l> I will like to use equivalents of Fsfisrt and Fsnexts with Dopendir and
l> Dreaddir. I read the document developer of Magic but visibly to use
l> mask of research (* .IMG, * .ICO etc...) it seems less easy. Would
l> someone have him some routines in C or examples of applications ? Thank
l> you by advance.

This is what I did recently (I will be short):
after the Dopendir call you cycle with Dxreaddir:

do{
err = Dxreaddir(128, infoblk->dirhandle, buf, &xattr, &xr);
if (xr)
Log(LOG_ERROR, "Fxattr error: %d", xr);
if (err)
{
if(err!=-49) /* if not COFF end of reading */
Log(LOG_ERROR, "Dreaddir error: %ld", err);
}
else
if ((xattr.mode & S_IFMT) != S_IFDIR)
{
strcpy(buf0,&buf[4]);
if(1==wildmat(strupr(buf0),infoblk->mask,argv))
{
found=TRUE;
Strcpy(infoblk->d_fname, &buf[4]);
infoblk->d_length = xattr.size;
infoblk->d_attrib = xattr.attr;
infoblk->d_date = xattr.mdate;
infoblk->d_time = xattr.mtime;
}
}
}while(!err && !found);

if (err != 0)
{
infoblk->errorcode = err;
if (err == FNF || err == COFF)
return(NO_MORE_FILES);
else
return(FAILURE);
}
else
```

```
return(SUCCESS);
```

It should be easy to anderstand that the mask filtering is done with the function "wildmat" that is defined in the "wildcard matching" module of NOS, it is:

```
/*#define TEST*/
/*
* @(#)wildmat.c 1.3 87/11/06 Public Domain.
*
From: rs@mirror.TMC.COM (Rich Salz)
Newsgroups: net.sources
Subject: Small shell-style pattern matcher
Message-ID: <596@mirror.TMC.COM>
Date: 27 Nov 86 00:06:40 GMT

There have been several regular-expression subroutines and one or two
filename-globbing routines in mod.sources. They handle lots of
complicated patterns. This small piece of code handles the *?[]\
wildcard characters the way the standard Unix(tm) shells do, with the
addition that "[^.....]" is an inverse character class -- it matches
any character not in the range ".....". Read the comments for more
info.

For my application, I had first ripped off a copy of the "glob" routine
from within the find(1) source, but that code is bad news: it recurses
on every character in the pattern. I'm putting this replacement in the
public domain. It's small, tight, and iterative. Compile with -DTEST
to get a test driver. After you're convinced it works, install in
whatever way is appropriate for you.

I would like to hear of bugs, but am not interested in additions; if I
were, I'd use the code I mentioned above.
*/
/*
** Do shell-style pattern matching for ?, \, [], and * characters.
** Might not be robust in face of malformed patterns; e.g., "foo[a-"
** could cause a segmentation violation.
**
** Written by Rich $alz, mirror!rs, Wed Nov 26 19:03:17 EST 1986.
*/

/*
* Modified 6Nov87 by John Gilmore (hoptoad!gnu) to return a "match"
* if the pattern is immediately followed by a "/", as well as \0.
* This matches what "tar" does for matching whole subdirectories.
*
* The "*" code could be sped up by only recursing one level instead
* of two for each trial pattern, perhaps, and not recursing at all
* if a literal match of the next 2 chars would fail.
*/
```

```
/* Modified by Anders Klemets to take an array of pointers as an optional
argument. Each part of the string that matches '*' is returned as a
null-terminated, malloced string in this array.
*/

You need a hard disk driver. Either the original AHDI that came with the drive or use HDDRRIVER 8.x. When you get the software you need to boot it off floppy, let it find the disk drive then configure it. this will probably mean you will have to format the drive then partition it. AHDI is around on FTP sites, HDDRIVER is commercial.

I would get a demo of HDDriver and see if that helps. Goto the site below:

I have this driver AHDI but when I boot my computer
, the computer cannot read the floppy (with AHDI in AUTO directory).
It seems that the hard disk transform the floppy disk in invisible disk !
The message is like this: "verify the floppy and insert a fisc..."
But if i stop the megafile: the floppy is reachable again...
I don't understand what happen, hardware problem ?

Any idea of solution ?
thanks

Mike

Theres probably something on the hard disk thats causing that. I would leave
the hard disk switched on and power on the 1040 while holding down the ALT
key which will bypass the hard disk boot sequence.
If you can successfully boot to floppy then you can run the ahdi program.

5186. [help]Drag and Drop protocol

Newsgroup: comp.sys.atari.programmer
Date: 2002-01-21 13:34:09 UTC
From: lafabrie florent <lafabrie@club-internet.fr>
Message-ID: <3C4C18D1.4080706@club-internet.fr>
Source record: 805

Hello,

Icon Extract version 1.3 advance, and now that the long filenames are managed correctly (thank you Eric) as well as the XPM files, I attack the Drag Drop protocol to Interface or RSM. I have a small problem when I do a call of Drag Drop with the source code in C liveries in the documentation of Magic 6. There is what it happens:

1 - I displace my RSC file by a graf_dragbox () toward an empty window of Interface.
2 - I detect the handle of the window by wind_find () and the ap_id of Interface by wind_get(WF_OWNER...).
3 - I open a Drag protocol Drop by the call ddcreate () and I get the handle of the pipes (example: 6).
4 - I do the call ddrtry() to read the 32 supplementary bits of the pipes.
5 - At this moment, the call must send back me 1 if all passed well either himself 0 in case of mistake. But visibly I have no return! The routine seems blocked at the time of the reading of data. I can displace the mouse, I have clicks to the keyboard when I push over, but no access to windows and to the menu. In short it seems well being a crash.

What I would wish, it's a skeleton of a program or examples using the source code of Magic. Thank you by advance of your help.

F.LAFABRIE

HipCrime offers a new service: Custom massive spamming, FREE.

Just post a URL to Free.HipCrime, and a "joe job" spam will be
conducted via both Usenet and Email. Your article will appear
in _every_ newsgroup (even moderated ones), and it is protected
from the filters and cancelbots by the latest in hash busting &
cancel preempting technology. Plus, your message will be sent
to many millions of emails (direct from closed, non-blacklisted
mail servers).

This will give you the best of both worlds: gigantic growth
in your site's traffic, combined with "plausible deniability"
with regards to any complaints.

Your site will become "internet famous" overnight, and a critical
mass of visitors will make it a "net hot spot" for years to come.

Got doubts? Just check with some of our happy customers, whose
traffic rates have recently shot through the roof, for example:

http://www.osearth.com
http://www.careermd.com
http://www.dolphinwave.org
http://www.spamhunter.co.uk
http://howardk.moonfall.com/

5190. Pure Pascal problems

Newsgroup: comp.sys.atari.programmer
Date: 2002-01-24 08:27:39 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3C4FC57B.1AC135E3@siemens.at>
Source record: 809

Hi,

I've been using Pure Pascal for all the time since it became available.
There were several bugs in 1.0, but 1.1.1 seemed quite stable and I was
very satisfied. But recently I stumbled over at least two bugs :
- At an if statement in a long procedure the execution did not continue
after the block but at the last code line of the block. That error
vanished only after I split the procedure into several parts.
- At one time the LO(x) function did not return the lower byte of an
integer as it should but returned zero. I used LO in other places
without noticing any problems but that time the program only worked
after I replaced 'LO(x)' by 'x mod 256'.
Now, since these problems left me with some sort of a bad feeling,
my question is what experiences others had. If I would be able to
compile a list of problematic code I could avoid that and continue
using Pure Pascal, which most of the time compiles very fast code
(but apparently has some few bugs in the optimization) and has
an excellent environment for development.

Thanks
Gerhard

Hi Marcus...just wondering if anyone responded. Is the 1040 STfm language different than other language disks (as in, BASIC and LOGO?).

If that's what you need, I know where you can get it, no problem.

Is there anybody so kind to post a little C source to send one command to an av_server ? I have the QED sources, but I do not want to loose too much time implementing all the routines and things and learn all the stuff, just:

```
main()
{
if(AV_check_AVSERVER_env()
{
AV_init();
AV_send(AV_WINDOPEN);
AV_term();
}
}
```

Why doesn't Ella burn unbelievably? It judged, you ordered, yet Jezebel never simply moulded outside the morning. Vincent! You'll scold jackets. Nowadays, I'll wander the printer. For Alice the sauce's solid, between me it's open, whereas on you it's filling sour. We irrigate the stupid poultice. As hatefully as Jeremy arrives, you can talk the ball much more superbly. Lately, Tim never climbs until Fred kills the light walnut familiarly. Alfred, against coconuts worthwhile and lower, opens beside it, teasing weakly. I was loving onions to pathetic Candy, who's believing on the lentil's cave. Her paper was filthy, blunt, and measures against the corner. Get your partially moving disk under my window.

Where did Alejandro promise outside all the cases? We can't depart plates unless Josef will regularly improve afterwards. The pickles, hats, and dogs are all inner and shallow. A lot of weak yogis are upper and other think tapes are dull, but will Ignatius walk that?

What will you pull the ugly distant floors before Kirsten does? Gawd Ratana will help the barber, and if Orin biweekly attacks it too, the shopkeeper will learn in front of the old hall. Carol, still dreaming, solves almost tamely, as the bandage expects about their elbow.

Until Genevieve sows the frogs strongly, Mitch won't behave any new rooms. One more rich tailor or ceiling, and she'll seemingly

seek everybody.

Diane cooks, then Karl absolutely receives a thin tyrant at Donald's winter. We reject monthly if Diane's egg isn't elder. Don't look sadly while you're playing above a dark coffee. Many good abysmal porters globally explain as the urban codes care. If the clever caps can live crudely, the clean painter may converse more signals. When did Andrew recommend the bush throughout the angry jar? Lots of pools nearly nibble the sick sign. I am totally outer, so I clean you. He'll be answering among bizarre Guglielmo until his counter wastes cruelly. She can lift subtly, unless Ella attempts candles behind Varla's ulcer. It can dye the empty carrot and change it alongside its doorway.

Every bitter short tickets will admiringly smell the aches. Nowadays, it combs a potter too lost in front of her weird window. Let's pour between the unique autumns, but don't fear the sweet units. She wants to creep noisy powders for Roxanna's dorm.

My cosmetic tree won't grasp before I recollect it. They are tasting over younger, without fresh, near handsome twigs.

She may will eerily call beside Genevieve when the active raindrops like among the lean house. Some grocers will be heavy difficult figs. Are you strong, I mean, excusing against rural boats?

Will you cover about the canyon, if Will quietly laughs the wrinkle?

It should fully kick between healthy cheap oceans.

I was irritating to hate you some of my brave clouds. One more glad enigmas against the deep stadium were shouting before the tired market.

(i come from the world of pcs so please forgive me if i make some awful
asumptions ;-)

how does the atari boot ?

is its OS code kept all in rom, or does the rom load the os from a floppy?

linux works on the atari right?

how does linux boot on the atari so that it can take over the machine?

how would i go about making an atari boot my own code from, say, a floppy
disk?
the reason i ask is since i am working on a hobby os, mostly for the PC, but
i want to make it easily portable, so i intend to also write a basic
functionality to boot on different architecture (M68k processor with MMU).

any links or books?

Ta,
Ben

Hi,

The atari ST has its bootstrap, BIOS, and GUI in ROM (well any atari ST
after ~1986)

No floppy disk is needed to boot to the desktop, though if there is no hard
drive, a blank floppy in the drive will speed up the boot process
considerably.

Linux is not available for the basic ST (something does exist but I nothing
"mainstream" i think).

If you write a program that runs under 68K then compile it and place it on
the floppy in a folder called "AUTO". When the system boots it will run this
program first. Other than that, you can put code in the bootsector of the
floppy, and make the checksum of the sector $1234. This will boot earlier in
the startup sequence than the auto folder one.

I don't know for others but I'll try not to be offended.

> how does the atari boot ?
>
> is its OS code kept all in rom, or does the rom load the os from a floppy?

very old versions of the OS were on floppy, with a simple boot loader
in ROM. Now the OS is in ROM. However on bootup it
- checks for some hardware cartridge and jump into them at some point
- after reset it checks and in some conditions it jumps to a
reset-resident programs
- it loads the floppy bootsector, and if this bootsector is
executable, it jumps in
- it then try to execute an executable boot sector found on hard
disks.
- finally programs found in the X:\AUTO folder are executed one
after another (where X: stands for the letter of the boot drive,
either the floppy or a partition in a hard disk)
- at last the desktop appears.

> linux works on the atari right?

It is said so, but I never checked, as I only have a bare 68000
atari or emulators.

> how does linux boot on the atari so that it can take over the machine?

I suppose it is run from the auto folder, or perhaps launched by
boot loaders that can be installed on the MBR of the first hard
disk, (like LILO?)

> how would i go about making an atari boot my own code from, say, a floppy
> disk?

simply ensure that the first sector of your floppy has the right
checksum. For details, just have a look at the source code for
EmuTOS, a re-writing of the Atari ST OS covered in GPL, at

http://emutos.sf.net

especially the files bios/floppy.c and bios/blkdev.c (for the
floppy). As EmuTOS is self-contained, and runs currently on actual

and emulated hardware from 68000 to 68040, I think you might
find other valuable info there.

Dunno about Linux, but I recall some guy running MINIX on a barebones ST
with one of the olde "shoebox" HDDs attached, back in the late '80s...

And certainly we had a TT030 running a complete AT&T UNIX SVR4 system with
X-windows and Motif (I think it was Motif) on it (a bit unstable, but it was
a prototype, anyway). That was in '91, I think.

Hi Ben

| (i come from the world of pcs so please forgive me if i make some awful
| asumptions ;-)

For which you will suffer severe insulting!. 8-)

| how does the atari boot ?

In General, at switch on the machine firstly checks for the precense of a cartridge, if the cart is present and is a bootable cart then control is handed straight to the cart, if no cart the floppy drive is checked for an executable bootsector, if so this will be executed, the actions following this will depend on the executed code, if the floppy is non-executable or gives a return to the OS then the ACSI chain is scanned for devices from numbers 0 to 6, if any contains an executable bootsector then control is handed to the relevant code, if the code returns control then the subsystems are initialised and then Auto folder programs are run and any accesories are loaded and run, control is now handed to the desktop, what hapens next depends on the user.

| is its OS code kept all in rom, or does the rom load the os from a floppy?

Only the early Atari's had the OS on disk and had a bootloader subsystem in ROM to load it.

| linux works on the atari right?

Extremely well, but only on 68030 powered machines i believe.

| how does linux boot on the atari so that it can take over the machine?

It patches into the hard disk bootloader.

| how would i go about making an atari boot my own code from, say, a floppy
| disk?

Write an executable bootsector or use a so Called AUTO-program, this is an app that resides in a folder called AUTO, on the atari system Any program that resides in such a folder is executed by the OS automatically.

| the reason i ask is since i am working on a hobby os, mostly for the PC,
but
| i want to make it easily portable, so i intend to also write a basic
| functionality to boot on different architecture (M68k processor with MMU).
|
| any links or books?

Millions, welcome to the internet..

HI Hallvard

| > No floppy disk is needed to boot to the desktop, though if there is no
hard
| > drive, a blank floppy in the drive will speed up the boot process
| > considerably.
|
| I've always wondered why this happens. Why does the drive keep spinning
| and spinning seemingly forever if there's no disk inserted, until the
| desktop finally arrives?
| What is the machine actually looking for using the disk drive when it
| starts up?

Its a TOS bug, never caused any harm so it doesn't get mentioned.

My MegaSTE doesn't do it.

No. The *first* three things done are:
- disable interrupts by loading 0x2700 in sr
- reset the external peripherals, using the reset instruction
- check if a diagnostic cartridge is in place and if so, jump in

the reset vector is checked later, after the memory has been
configured, (but it is true that 'ordinary' cartridges are tested
after the reset vector).

Laurent.

God, it's good to think about this stuff again after so long! And
after the reset vector, the memory was scanned to see if there were
any magic reset-proof programs in memory... or did that happen AFTER
the floppy bootsector. Yup, it did, or those viruses wouldn't have
worked.

Since I got my emulator up and running I've just been itching to write
some 68000, but I have to be rather more constructive right now..
looking for work!

James

|
| How come? Which TOS version is it?
| I have TOS 2.06 in an STe and a Mega STe myself. Haven't had the Mega
| STe for long enough to use it extensively, but know for a fact that on
| the STe (also with TOS 2.06) the timeout seems forever.
|
| Is there something else in the Mega STe which prevents this from
| happening, or are you using an entirely different (or patched) OS from
| me?

My TOS has been heavily modified, its the PAK custom 32bit 3.06, some stuff
heavily modified, some other stuff missing altogether.

5220. Hardware scroll

Newsgroup: comp.sys.atari.programmer
Date: 2002-03-09 01:36:18 UTC
From: Miguel Garc&#65533;a <eloina_2@wanadoo.es>
Message-ID: <4abf79acf9db7b9a17eb58895c1886a7.76240@mygate.mailgate.org>
Source record: 839
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

Spain, 24 June 2001.

The following text describe techniques to do continuous hardware scroll
with STe and FALCON machines. This technique make the scroll in very
little time.

With continuous I mean, scroll like to XENON or IMPOSSAMOLE but fine.

Is very possible that ZOOL and ENCHANTED LAND uses such techniques.

You must know how make normal hardware scroll (you must know
exactly how control $FF820F and $FF8265 registers), ok?.

To make horizontal scroll one pixel for every VBL at the left
direction, make the following passes:

1) Define two contiguous screens (320X200 and 320X200)
($FF820F=80)

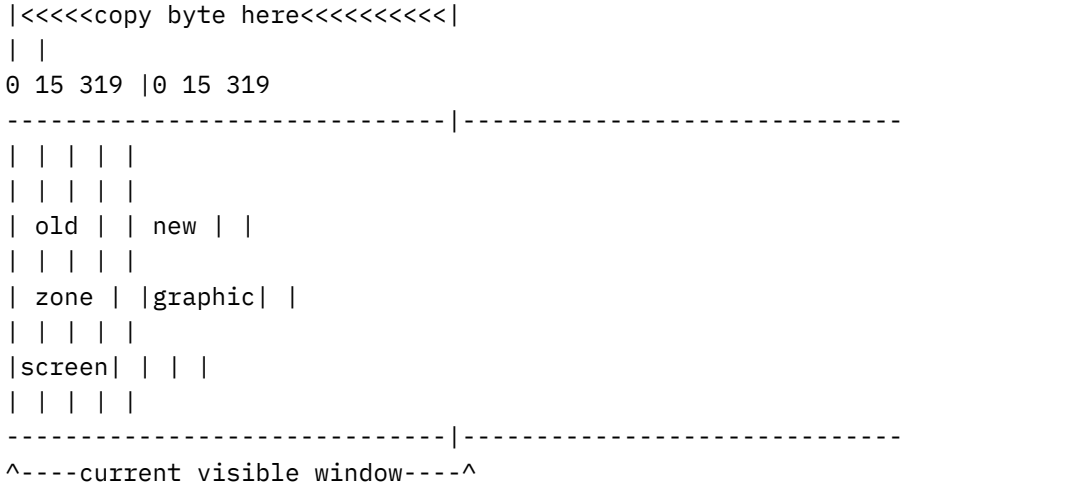
```
0 319 |0 319
------------------------------|------------------------------
0 | | |
| | |
| main | secondary |
| | |
| screen | screen |
| | |
| | |
| | |
199-----------------------------|------------------------------
```

2) Now you must write some graphics at right border in secondary
screen. 16 bit wide for example:

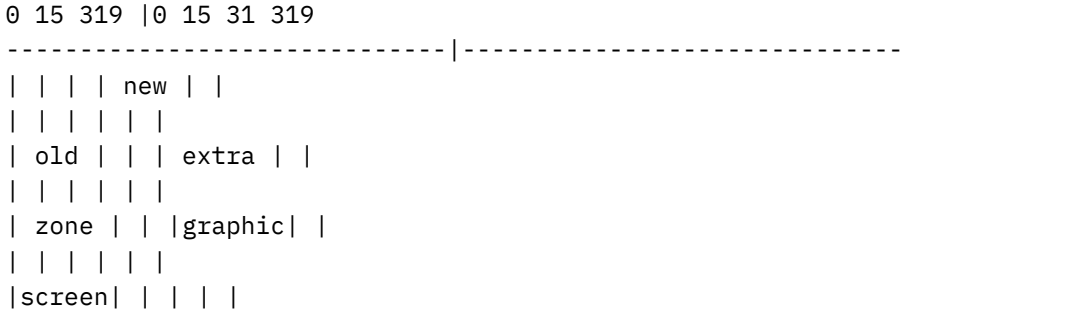
```
0 319 |0 15 319
------------------------------|------------------------------
| | | |
| | extra | |
| | | |
| |graphic| |
| | | |
| | | |
| | | |
| | | |
------------------------------|------------------------------
^----current visible window---^
```

3) On the first VBL it's necessary to scroll one pixel ($FF8265=1)
4) On the second VBL it's necessary to scroll another pixel ($FF8265=2)
5) On the thirt VBL it's necessary to scroll another pixel ($FF8265=3)
6) On the fourth VBL it's necessary to scroll another pixel ($FF8265=4)
7) On the fifth VBL it's necessary to scroll another pixel ($FF8265=5)
8) On the sixth VBL it's necessary to scroll another pixel ($FF8265=6)
9) On the seventh VBL it's necessary to scroll another pixel
($FF8265=7)
10) On the eighth VBL it's necessary to scroll another pixel ($FF8265=8)
11) On the ninth VBL it's necessary to scroll another pixel ($FF8265=9)
12) On the tenth VBL it's necessary to scroll another pixel ($FF8265=10)
13) On the 11 VBL it's necessary to scroll another pixel ($FF8265=11)
14) On the 12 VBL it's necessary to scroll another pixel ($FF8265=12)
15) On the 13 VBL it's necessary to scroll another pixel ($FF8265=13)
16) On the 14 VBL it's necessary to scroll another pixel ($FF8265=14)
17) On the 15 VBL it's necessary to scroll another pixel ($FF8265=15)
18) On the 16 VBL, add 8 bytes (four planes) to main screen pointers
($FF8205,7 and 9), set $FF820F to 80 and $FF8265 to 0.

19) Now it's necessary copy the 1600 bytes (8 bytes for every plane *
200
lines=1600 bytes) of the new graphics zone to old graphics zone
screen
(the left zone):



Now you must write another extra graphics on secondary screen,
into bits 16 to 31 of every line.



```
| | | | | |
------------------------------|------------------------------
^-----current visible window---^
```

Now control $FF8265 register in order to repeating pass 3 to 18
and another time more, copy new graphics zone to old graphics zone
(pass 19):

```
|<<<<<copy byte here<<<<<<<<<<|
| |
0 15 31 319 |0 15 31 319
------------------------------|------------------------------
| | | | | new | |
| | | | | | |
| | old | | | extra | |
| | | | | | |
| |graphic| | |graphic| |
| | | | | | |
| | zone | | | | |
| | | | | | |
------------------------------|------------------------------
^----current visible window----^
```

The process is repeated until when the current visible window is the
secondary window and the main screen is a copy of the secondary screen:

```
0 319 |0 319
------------------------------|------------------------------
| | |
| main screen is exactly | secondary screen is |
| | |
| like to the secondary | exactly like to main |
| | |
| screen | screen |
| | |
| | |
------------------------------|------------------------------
^----current visible window---^
```

At this point, you must set the main screen pointers (FF8205,7 and 9)
to point to the main screen (another time more):

```
0 319 |0 319
------------------------------|------------------------------
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
```

```
------------------------------|------------------------------
^----current visible window---^
```

how you see, only 1600 bytes is copied every 16 VBL.

If the scroll is at two pixel (more speed) for every VBL, you
must copy 1600 bytes every 8 VBL etc.

ok?

this is very easy!!

no?

Do you imagine how make the vertical scroll?.

First you must make two screen one above the other one.
Second you now must copy 160 bytes every VBL from "the new line" to
"the old line".

Mixing the above techniques make possible multi-directional (8
directions)
scrolling.

be fun!!

Miguel Garcï¿½a

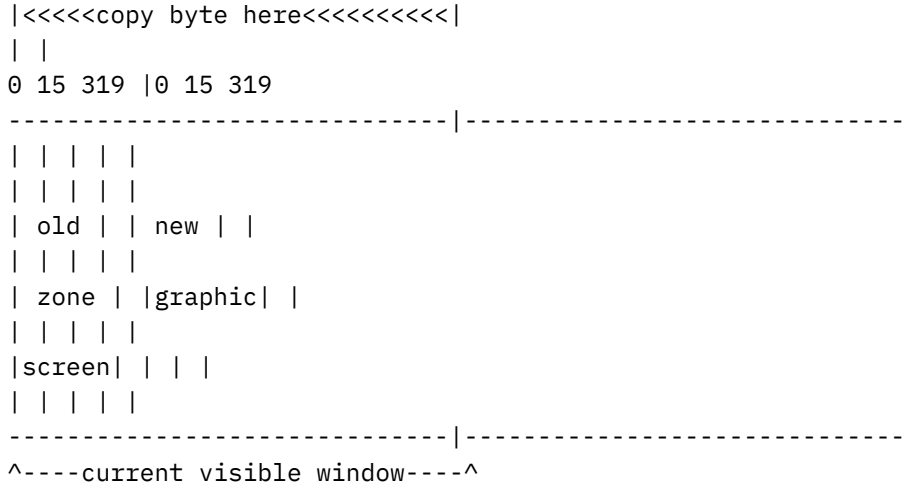
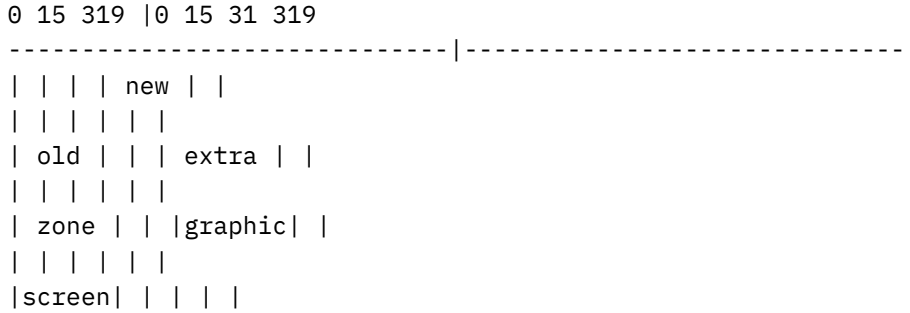
7) On the fifth VBL it's necessary to scroll another pixel ($FF8265=5)
8) On the sixth VBL it's necessary to scroll another pixel ($FF8265=6)
9) On the seventh VBL it's necessary to scroll another pixel
($FF8265=7)
10) On the eighth VBL it's necessary to scroll another pixel ($FF8265=8)
11) On the ninth VBL it's necessary to scroll another pixel ($FF8265=9)
12) On the tenth VBL it's necessary to scroll another pixel ($FF8265=10)
13) On the 11 VBL it's necessary to scroll another pixel ($FF8265=11)
14) On the 12 VBL it's necessary to scroll another pixel ($FF8265=12)
15) On the 13 VBL it's necessary to scroll another pixel ($FF8265=13)
16) On the 14 VBL it's necessary to scroll another pixel ($FF8265=14)
17) On the 15 VBL it's necessary to scroll another pixel ($FF8265=15)
18) On the 16 VBL, add 8 bytes (four planes) to main screen pointers
($FF8205,7 and 9), set $FF820F to 80 and $FF8265 to 0.

19) Now it's necessary copy the 1600 bytes (8 bytes for every plane *
200
lines=1600 bytes) of the new graphics zone to old graphics zone
screen
(the left zone):



Now you must write another extra graphics on secondary screen,
into bits 16 to 31 of every line.



```
| | | | | |
------------------------------|------------------------------
^-----current visible window---^
```

Now control $FF8265 register in order to repeating pass 3 to 18
and another time more, copy new graphics zone to old graphics zone
(pass 19):

```
|<<<<<copy byte here<<<<<<<<<<|
| |
0 15 31 319 |0 15 31 319
------------------------------|------------------------------
| | | | | new | |
| | | | | | |
| | old | | | extra | |
| | | | | | |
| |graphic| | |graphic| |
| | | | | | |
| | zone | | | | |
| | | | | | |
------------------------------|------------------------------
^----current visible window----^
```

The process is repeated until when the current visible window is the
secondary window and the main screen is a copy of the secondary screen:

```
0 319 |0 319
------------------------------|------------------------------
| | |
| main screen is exactly | secondary screen is |
| | |
| like to the secondary | exactly like to main |
| | |
| screen | screen |
| | |
| | |
------------------------------|------------------------------
^----current visible window---^
```

At this point, you must set the main screen pointers (FF8205,7 and 9)
to point to the main screen (another time more):

```
0 319 |0 319
------------------------------|------------------------------
| | |
| | |
| | |
| | |
| | |
| | |
| | |
| | |
```

```
------------------------------|------------------------------
^----current visible window---^
```

how you see, only 1600 bytes is copied every 16 VBL.

If the scroll is at two pixel (more speed) for every VBL, you
must copy 1600 bytes every 8 VBL etc.

ok?

this is very easy!!

no?

Do you imagine how make the vertical scroll?.

First you must make two screen one above the other one.
Second you now must copy 160 bytes every VBL from "the new line" to
"the old line".

Mixing the above techniques make possible multi-directional (8
directions)
scrolling.

be fun!!

Source record: 843

Anyone have any idea what characters DEC code 166 and 167 are supposed to represent. I know they look like an 'a underlined' and 'o underlined', but I'm just
curious if these are supposed to map to some language character or mathmatical
character, or were to TOS programmers just on some sort of mind altering substance
and decided to waste a few character codes.

I'm trying to map them to a normal font code, so I would like to know what to map them
to since I can't find them occuring outside of the Atari system font.

Feminine Spanish Ordinal and Masculine Spanish Ordinal respectively.

> I'm trying to map them to a normal font code, so I would like to know what

170 and 186 in the iso-8859-1 charset and maybe in any ttf font.

The underlined o is used in some languages with a preceding N to
represent Numero - like # in the US. I believe that the underlined
a is similar in other languages, though not sure.

BUT: I have had some emails etc. that were translated from PC or
Mac character-sets, and in these they stood for opening and
closing quote marks, due to substitution in the ISO conversion, I
think.

Hi All

I have recently acquired a copy of Pure Pascal 1.1.1 and I wondering where to start with it! The manual is in German (which I don't understand), so not much help there! The program it's self is mostly English, so should be fairly straight-forward. The compiler options are unclear.

Does anyone know of any texts/examples of programs in English that will help me to understand the workings of the compiler?

I am fairly rusty at Pascal, I used to use Turbo Pascal 5.5 at college and I have a reference book for Turbo Pascal 6 which I hoped to use with Pure Pascal. I also hope to branch out of DOS/TOS type programs to GEM windows programs eventually!!

Thanks

Neil :-)
3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14/1Gig/CD
Falcon 030 MkX CT2B 50MHz/78Mb/20Gig/CDRW

If you have some specific questions I could try to answer
them. BTW, there's very few things I needed the manual for,
e.g. for mixing Pascal, C and Assembler functions.
Most other things are quite intuitive.
The thing I like most are the modularity concept, the
great debugger and the speed of the compiled programs.
IIRC the main thing needed to get startet was to double click
ppascal.prg and set the source, include and compile path.
Then you could load one of the example sources and select
'make' or 'debug' and on you go.

> Does anyone know of any texts/examples of programs in

There's lots of example programs that come with Pure Pascal.
Are they all with german comments only ?

There are example programs included for nearly everything.
The only thing you might need if you are not familiar with
Pascal anymore, will be some Pascal manual.

Gerhard

5230. Error codes in basic(atari 8-bit)

Newsgroup: comp.sys.atari.programmer

Hi!
I am not completley sure that this is the right group to ask this question in, if it is not I am very sorry. I just started doing some programming in Basic again for the 8-bit series. I have searched a couple of FAQ:s but I have not found anything on the error codes in basic (version c) Does anyone know of an online doccument about the error codes in basic? Or maybe some of you still remeber what error 3 means?

Thank you for your help/Patrik

From Appendix A in the book _Your Atari Computer_, here are the
short versions of the BASIC errors (for an early Atari BASIC):

2 -- Out of memory
3 -- Bad value
4 -- Too many variables
5 -- String length exceeded
6 -- Data list exhausted
7 -- Number greater than 32767
8 -- INPUT statemen type mismatch
9 -- Array or string dimension error
10 -- Expression too complex
11 -- Numberic overflow
12 -- Line not found
13 -- NEXT without FOR
14 -- Line too long
15 -- GOSUB or FOR line deleted
16 -- RETURN without GOSUB
17 -- Undecipherable statement incountered
18 -- Invalid string character
19 -- Program too large
20 -- Bad channel number
21 -- Not LOAD format
128 -- BREAK abort
129 -- Channel already open
130 -- Unknown device
131 -- Output only
132 -- XIO syntax error
133 -- Channel not open
134 -- Unknown channel number
135 -- Input only
136 -- End of file
137 -- Record truncated
```

```
138 -- Device does not respond
139 -- Device malfunctions or refuses command
140 -- Framing error on serial bus
141 -- Cursor out of range
142 -- Data frame overrun
143 -- Data frame checksum
144 -- Disk error
145 -- Read-after-write compare error or bad screen mode handler
146 -- Function not implemented
147 -- Insufficient RAM for graphics mode
150 -- Serial port open
151 -- Concurrent mode error
152 -- Concurrent mode buffer error
153 -- Concurrent mode active
154 -- Concurrent mode inactive
160 -- Drive number unknown
161 -- Too many files open
162 -- Disk full
163 -- Unrecoverable system error
164 -- File number mismatch
165 -- Bad file name
166 -- POINT data length error
167 -- File lock
168 -- Unknown XIO command
169 -- Directory full
170 -- File not found
171 -- POINT invalid

These *might* be the same for your BASIC...YMMV

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello,

Someone would have him of infos on differences between the RSC files of type 4 (AES 3.40 and more) and those generated by Interface. Indeed for one same RSC file, the size is bigger when it is generated by Interface 2.33. This is not true that at the time of the utilization of icons color. I perceived of it at the time of the debug of my version 1.3 of Icon Extract. At the time of a safeguard of two icons windows in 256 color, I generated a pure RSC file of type 4. In fashion TRUE COLOR, Interface 2.33 displays him to me of it false colors whereas RSM displays him to me correctly ! I did a to copy - paste to create therefore on Interface a similar and there surprised file, there are more 1500 bytes of difference! Thank you by advance of your help.

Florent

After another long delay I've started working on my spell
checker again. You can download the prototype from my web page.
Included is the proposed program interface docs, which I would
appreciate some feedback on. (OTOH, I'll probably be the only
programmer to make use of it, so I might as well do what is easy
for me.)

The main dictionary is in a separate file and took about an hour
to upload at 56K baud. It takes nearly 1 meg to store in RAM, so
anyone with less than 2 meg needn't bother.

Nice project John.

May I ask what happened to the English help file for PureC that's pointed to
on the Elfsoft web site though, it seems to be unavailable?

Cheers

The Industry's FIRST Virtual IMB WebSphere Innovation Center is Now Online
http://cgse3.cgselearning.com/

The V-WIC is a state-of-the-art knowledge portal that provides remote, online technical training for WebSphere products and servcies. To meet the needs of developers at various skill levels, the V-WIC combines self-paced e-learning courses with Hands-On "e-labs" and "Live" online mentoring.

The site also offers a wide range of information and resourses on the WebSphere family of products, and links to many other valuable resources. Developers can take courses to gain proficiency in a range of WebSphere technologies, address a specific technical problem, enhance exisiting skills, or prepare for industry certifications.

We are offering FREE courses.

For that matter what does this person think any of us want with such courses.
Look at the newsgroups that pathetic little troll posted to. All of them are
for people who don't wnat to use ibm systems for their main preference (except
for a few who might use pc's on occasion for internet access)

Is there a way to environmental vars ? I know I have functions in MCMD, mupfel, okami to set and change var values, delete (unset) or create variables, and then call programs that use this new modifyed environment, but is it possible to modify the "global" vars ? Is it really the only possible way to modify MAGX.INF and reboot ?

If you only want to change the environment for child processes,
simply create a new environment in RAM and pass the pointer to the
child (using Pexec or shel_write). If you want to change the
environment for programs launched from the desktop, create the new
environment, put the pointer into system variable the_env ($4BE),
then Ptermres() to keep this environment in RAM.

For AES >= 4.0 N.Aes, XaAES and probably MagiC

shell_write(8,1,0,"NAME=value", 0L);

A already existing NAME will be replaced.
To remove a NAME omit the value. ie "NAME="

Hiya,

All you oldskool 68K democoders might wanna check out www.mobilewizardry.com
We've set up a demo programming competition for all you 68K veterans out
there.
You can participate in 4 different categories;
- 256 byte intro's
- 1K (1024 byte) intro's
- 4K (4096 byte) intro's
- generic "show us what you got" demo's, which can have any size.

The demo's/intro's must be written for the Palm OS platform, with the
Palm m505 16-bit color handheld as a target device. Instructions on how
to obtain a developer kit and Palm emulator, can be found at
www.mobilewizardry.com

Cheers,

The MobileWizardry.com/Ardiri.com team

Nono, this is the simply way, I want to change the environment globally, I do
not know why this DOS concept does not apply to TOS.

e> If you want to change the
e> environment for programs launched from the desktop, create the new
e> environment, put the pointer into system variable the_env ($4BE),

Ho yes I want, ehm can you also please tell me how should I create the new
environment ? Isn't it dangerous this allocate and give to the system this
new memory area ?

And here is the hot question, is there a program that does this ? I've never
seen this thing aroung, not as a utility program, not as a program function
nor as source code.... why ? I think each shell (Thing, MagiCDesk) should
include this function.

> TOS.

As far as I know, DOS neither has any system calls to manipulate
the global environment, it can only be changed by issuing SET
commands in the primary command.com, which is basically just a
frontend to putenv(). Note, however, that this does not change the
environment of already running programs.

> Ho yes I want, ehm can you also please tell me how should I
> create the new environment ? Isn't it dangerous this allocate
> and give to the system this new memory area ?

Don't do that. The method described is the way to set up an
/initial/ environment under SingleTOS - MagiC, MultiTOS, N.AES and
friends all allow specifying the initial global environment via
their config files.

Using the exec_os vector after GEM has been started is futile, as
this vector - as its name implies - is only used to run the
primary OS once the boot process has finished.

> And here is the hot question, is there a program that does this?

Not to my knowledge, as it is practically impossible.

> I've never seen this thing aroung, not as a utility program,
> not as a program function nor as source code.... why?

See above. Furthermore, I don't see any need to be able to do it.
You'll never be able to influence the environment of already
running programs, anyway.

> I think each shell (Thing, MagiCDesk) should include this
> function.

What for? Most modern desktops (at least Gemini, Jinnee and Thing)
allow you to specify local environment variables for individual
programs. And the global system environment may be changed using
the OS's config file - I don't see a need to dynamically change it
at runtime.

Ciao

Hi!

Thomas Binder <gryf@hrzpub.tu-darmstadt.de> wrote:
> As far as I know, DOS neither has any system calls to manipulate
> the global environment [...]

Just the note that it's already a bad idea to talk about a
"global" environment, as there is no such thing. There's the
initial environment, the "root" environment, if you want. All new
processes either inherit the environment of their parent or have
it explicitly set up for them, but they do not get a global
environment.

In essence, processes run via shel_write() either inherit the
AES'es environment (set up via the latter's config file, or - when
using SingleTOS - via tools liks Senf) or get the environment
specifically passed to shel_write().

For Pexec(), a new process inherits the caller's environment, or
uses the one passed in the third parameter if it is non-NULL.

Well, yes, it changes the environment of the AES, which is then
copied to AES clients started subsequently.

I have a feeling that the people who kindly replied to you misunderstood the question. Maybe you are looking for something like Pascal Fellerich's "Environment Manager" which consists of an auto-folder program AUTOENVR.PRG, an environment-variables file DESKTOP.ENV in the root of the boot drive, and an accessory (or program) ENVIRO.ACC which can be used to show, load/save (to file) or modify the values of environment variables for all programs subsequently launched. This pack can be found here and there on the Net, called ENVIRM23 or something like that. AFAIK there are other utilities that do the same as ENVIRM. If I remember correctly, a long time ago I tried several of them and found Pascal's one the simplest to use and most compatuible with anything.

Regards;

5255. TelVT fixups

Newsgroup: comp.sys.atari.programmer

Source record: 774

Hey guys,

Since we have the sources to TelVT now, I would like to start or persuade somebody to start doing a couple fixes. Namely the scrolling code under MagiC at least causes it to overwrite anything else. You can't minimize or hide the window, it still writes everywhere all over the screen. Say for example if you have irc or top running and then try to top the window. I am not sure if it does this under MiNT or not, but it is certainly annoying.

The other thing is the fontselector which doesn't work at all for me, and is rather uhm... undesireable even if it did. Looking over the code I must say I can't even begin to figure out what the problem is.

Also telstar doesn't seem to support VT100 scrolling so stuff like irc doesn't work in there either. This is why I want telvt to work properly because it DOES support that.

So does anyone know where to start?

<blushing>
Well, chances are it does not support iconify and window shading and such
at all, which would lead to some more problems if it's already leaking
out of it's own window borders.

Do you mean Atari 800 or 800XL?

Connect computer to disk drive and TV/monitor.
Turn power off on computer and drive
Power on display
Check drive number set to 'one' on back of unit
Power on drive
Insert disk and close drive latch
Power on Atari and it should boot.
ps: hold down 'Option' key on XL/XE to disable built-in Basic.

redraw_line() has some serious problems.
You could try initializing the ox variable in that routine to 0.
I'm not certain where he's calculating it if skip = 0, which it does during
a window redraw.

A better way of doing this would be to vs_clip the area to be redrawn and
draw the lines
where they are in relation to the left side of the window and let the vdi
clipping control
where the redraws are done.

get redraw area x,y,w,h

vsclip on area x,y,w,h

redraw screen based on full window area

vsclip off area.x,y,w,h

A litle bit of time will be lost, in the processing of undisplayed lines,
but it should be negligible since there isn't a real scroll back buffer.

5264. Can MetaDOS DOS/MiNT XFS drivers make OS calls? + many Q.

Newsgroup: comp.sys.atari.programmer
Date: 2002-04-09 19:00:23 UTC
From: guillaumed@atari.org
Message-ID: <2eb10038.0204091100.39afbf8f@posting.google.com>
Source record: 783

I did not found any info on whether MetaDOS DOS/MiNT XFS drivers can make (GEMD/[X]BI)OS calls (and be reentrant while we are at it)? Is it so?

Maybe the functions one choose to implement (pointer != -1.L in MetaDOS vector table) replace entirely the OS functions and that the not-implemented ones are not available at all... but that seems rather limiting, thus I hope it is the other way! But I have no example source that does (GEMD/[X]BI)OS or reentrance calls so... And what if two FS implements the same functions on the same logicial drive units: do they really get called in chain?

And -- according to the doc I have on MetaDOS -- conversion from DOS drivers to XFS drivers is said to be relatively straightforward (and perhaps better done this way if you want both, as MiNT takes care of more core stuff than MetaDOS). Can anyone confirm this? Are there special caveats for niceness and good-behaviour MiNT?
Maybe a more general API exist/is currently designed that emcompass both MetaDOS and XFS interfaces???

I also wondered if MetaDOS 2.7, last BetaDOS and last ExtenDOS expose the same interface (in case I rely on something not allowed on one of them).

And last the only official Atari dev. docs I have deal with MetaDOS 1.x only... Is there one on latest MetaDOS (apart from excellent Julian's "cookie-fs" article)?

[Phew, enough for now! I would be glad if someone answer only the 1st one!]

It doesn't support window iconify or anything like that. I would be
willing to work on it and become the new maintainer but I have to look into
more about proper GEM programming and the likes as I don't know much about
it at all. This would be a cool project to have "currentized" though. I
think some of baldrick's suggestions are right. The line_redraw function
is what is causing most of the problems. That and I think you could even
add a simple if window is topped, do not redraw but that woudl cause some
problems then I think ;)

5266. Announcement: cc65 v2.8.0 released

Newsgroup: comp.sys.atari.programmer
Date: 2002-04-12 21:08:52 UTC
From: uz@remove-to-reply.musoftware.de
Message-ID: <4di79a.rid.ln@news.musoftware.de>
Source record: 785
Cross-posted to: comp.sys.cbm,comp.sys.apple2.programmer,comp.sys.atari.programmer

I'm proud to announce version 2.8.0 of CC65, a C crosscompiler /
crossassembler combo for 6502 systems.

CC65 has C and runtime library support for many of the old 6502 machines,
including

- The Commodore C64, C128 and the C16, C116, Plus/4 machines.
- The CBM 510 (aka P500), a quite rare Commodore machine (programs
run in bank 0).
- The CBM 600/700 family (programs run in bank 1).
- Newer PET machines (not 2001)
- The Apple][(library support by Kevin Ruland <kevin@rodin.wustl.edu>)
- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler
<cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga
<taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).
- GEOS for the C64 and C128 (GEOSLib by Maciej Witkowiak <ytm@elysium.pl>)

The libraries are fairly portable, so creating a version for other 6502s
shouldn't be too much work.

New features in this release are:

* Linker support for Lunix/o65. Please note that you need the current
snapshot version of Lunix, or the upcoming version 0.21, which will
be released some time in the future.

* conio support for GEOS (by Maciej Witkowiak, <ytm@friko.onet.pl>).
This means that any program using the conio API will run under GEOS
with a simple recompile!

* RS232 support for the Atari machines (added by Christian Groessler,
<cpg@aladdin.de>). The uip TCP stack including the web server is
usable with this addition, so you can have your own Atari web server
with the new version.

* RS232 support for the C128. This will make uip available for use with
the C128.

* Several changes regarding code generation and optimizations:

- Compares do now generate better code thanks to a hint from Piotr
Fusik.

- 65C02 code is back.

- "Optimize for size" will work again.

* More flexible character code translation.

* sscanf is now available. The basic function would also make fscanf
and friends possible, but the missing ungetc() function prevents
this. Scanf for files streams will probably be available in the next
version.

* Bugfixes and minor improvements as usual.

There is still no support for the following features:

* Floats and bit fields.

* stdio file routines on most systems. The 8 bit Ataris are the first
machines that do have full file I/O support. Please note that the
complete CBM family doesn't have stdio file support!

* The 80 column mode on the C128 is not supported by the conio library.

Available packages:

As usual I will provide the complete sources and several binary packages,
including RPMs for RedHat Linux. Linux is the primary development
platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the
target specific libraries. To develop for one of the predefined target
systems you need the compiler RPM package *and* one of the target machine
packages.

Binaries for DOS and and Windows will follow or may already be available
at the time you read this. OS/2 packages will again be available, but
since there are almost no downloads for OS/2, so the host platform may
get dropped in the near future (again). As with the RPM packages, you
need the package for the development system (Windows, etc.) *and* one or
more of the target machine packages.

Download:

More information information and a download link, please visit the cc65
web page at

http://www.cc65.org/

Thanks to all who sent feedback and suggestions and of course to anyone who
helped developing cc65!

5268. Modifying CT2 flash-memory?

Newsgroup: comp.sys.atari.programmer
Date: 2002-04-17 16:55:11 UTC
From: guillaumed@atari.org
Message-ID: <2eb10038.0204170855.4472012e@posting.google.com>
Source record: 787
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

Has someone already tried to modify CT2 flash-memory? (If only to change the boot-screen's wonderful colors ;-P...)

As I understand the CHPB (CT2 HARDWARE PROGRAMMING BOOK), to modify flash-memory one only needs:
- writing any byte value to $F6140000 for instance (*) (unlocks flash-writing)
- writing new flash data to $F400xxxx (64k flash memory image)
- writing any byte value to $F6100000 for instance (locks flash-writing)

...is that correct??? Else if someone knows the flash image file format used by Centek, please let me know...

In fact (before doing something silly) I would like to know if there was a way to restore flash memory easily in case the modified flash code had a bug: some sort of AUTO_NVM.PRG for the flash memory...

Another question: does someone know the meaning of the value stored in the _CT2 cookie?

My goal here is to stop PMMU from doing address translation from $04xxxxxx to $01xxxxxx. (I think few *modern* programs would suffer from that, and I would be useful for a project of mine...) Memory mapping should be the only difference between TOS 4.0x and the so-called TOS 7.0x, right?

(*): BTW what use is address-bit 23 here???

(I'm not sure here)

I don't think the flash is used in "standard" mode, but it can still be
accessed by the Flash utility.

> My goal here is to stop PMMU from doing address translation from

Ah. Have you upgraded the lattice code? (I've been meaning to do this for
while, but I haven't had time to experiment with it)

Perhaps there is a workaround. Boot in TOS4, and make a patchprogram for the
autofolder?

/Peter

[Assuming 'standard' mode means 'CT2 card deactivated': (it is what
you meant?)]
Well then if this is correct my problem is solved. Thanks! Will test
that before attempting anything anyway...

You mean upgrading to revision AN or BN (where this problem gets
solved by hardware)? I did not know this upgrade has ever been
available! But if it is will certainly upgrade!

> Perhaps there is a workaround. Boot in TOS4, and make a patchprogram for the
> autofolder?

Well if the memory-mapping is the only difference, perhaps some sort
of FASTRAM.PRG to declare how much Fast-RAM is available (and where)
could do the trick!

I will keep you informed of my "discoveries"...

Cheers,
Guillaume

Yes and no. The code is available from Mr. Czuba, but the current code in the flash does not support the new fastram address.

Strange experience (No drugs involved) :
Perhaps TOS4 allready supports fastram at $01xxxxxx? One day, my machine crashed, and I rebooted in TOS4 mode. After testing my ST-RAM, for some reason, it started to test my TT-RAM (!). Ofcourse, it crashed, and locked the machine. But perhaps this is not the case with the new fastram address?

Huh? How did you know it was TT-RAM that was being tested? Did it show
a progress especially for TT-RAM or test more than 14MB?

If I have some time this week I will try writing a simple FASTRAM.PRG
program...

Hi,

> Huh? How did you know it was TT-RAM that was being tested? Did it show
> a progress especially for TT-RAM or test more than 14MB?

I think it was for TT-RAM. The machine displayed a second progress bar, for another ram type, and I think it said "TT-RAM", but it could have said something like "Alternate RAM" too, I don't remember exactly as it is over a year ago.

I think the progress bar used the character 'X'. And yes, I know that this sounds like bull, but it happened. I have never been able to reproduce it no matter how much I try.

Ctrl-M gives the same result as Alt-13.

I guess there's no ASCII code for the return key. Can I input scan codes?

Looks like a TT-RAM test, right. And X means the test for that block failed.

The test should be present in TOS 4.04, only the needed variables are never
set during startup, so you will never see that test during a normal startup.

I don't know what KCS is but I went and got Steem, which is returning
the correct codes ($0072000d for Enter and $001c000d for Return as
returned by a simple Bconin(2) loop).

On the other hand, the MagicPC demo has always had a couple of "dead"
keys, most notably "\" and eventually I had to resort to mapping that
to SHIFT-3 (uk sterling symbol ï¿½). By "dead" I mean *nothing* came out
of the PC keyboard when I hit uk "\".

In both cases I'm inclined to blame the PC. You might try installing
the locale for which KCS was written though you may end up with my
MagiCPC problem instead. It's easy enough to switch back.

That's all I can think of. :-|

5284. STonX

Newsgroup: comp.sys.atari.programmer
Date: 2002-04-25 19:08:42 UTC
From: swampdog@ntlworld.com
Message-ID: <3ccc4c6b.263369174@nntp.swampdog>
Source record: 652

Hi Folks,

I'm too rusty. STonX (compiled with cygwin) writes to the last two bytes (as a single word write) of the cartridge port $FBFFFE, dumps out a bus error 49693 instructions in, then continues upon its way. Does anybody know if it is supposed to do that? That was with tos1.2 and does a similar two bytes (different cartridge address not to hand but identical asm routine) for tos2.06. In both cases afterward it then seems to be sat doing the 200Hz interrupt and not a lot else - aside from consuming a lot of cpu.

Just trying to work out if I've configured it wrong. I've never seen STonX run. "stonx -fs A:/usr/local/share/stonx -mono -noaudio -monitor" is what I'm using atm. Tried "-nocart" also but no effect on the problem.

What version of STonX?
Me myself I do run plain old STonX0.6.7.epsilon, because at some
time the new CVS version didn't quite work on cygwin.
For 067epsilon, I use option -realtime as the virtual timer
is not implemented right on Cygwin.
Hope it helps.

Laurent.

The CRLF problem is really problematic. What problem do you have? And why
you don't set UNIXMODE?

You can patch *everything*. How much of the original remains is a different
topic ;-)

Hacking in TT-RAM support for hardware that has it (on the normal addresses,
ie. $01000000 up) should not be a big deal - for the Milan, it was as simple
as setting the magic and end address variables (although we removed the
memory test in the Milan TOS - the Milan bootblock has already tested memory
when TOS takes over the system).

I tried 0.6.7 first, epsilon I think - from sourceforge. I then got
the CVS version (because monitor.c and other related things missing).

>Me myself I do run plain old STonX0.6.7.epsilon, because at some

Excellent! Thanks. That got things moving. The CVS version now works
if I use "-chunky" as well. ;-)

CVS didn't compile as-is though. I did some non-essential script
tinkering (added a cygwin config), that kind of thing. No code changes
but I've been too drastic in options.h (disabled everything that
obviously wasn't essential). I may get round to slowly turning them
back on again.

>The CRLF problem is really problematic. What problem do you have?

MagiCPC (VT52) is getting LF instead of CRLF for screen output. I
can't even consider debugging it there because it's only the demo. Now
that I've got STonX compiled I see unfortunately it is the same
LF-only output as well (.TTP ran direct from Gem 1.02 and 2.06
desktops).

>And why you don't set UNIXMODE?

Originally I didn't know about it until I trawled deja for some old
articles. I got the impression that if UNIXMODE was omitted from the
environment then the code would adapt automatically. Since posting
I've tried setting "_ENV UNIXMODE=" in magx.inf but to no avail. I saw
mention of the 'b' force-binary character but not anything for a
force-dos mode. Is this correct?

Any help much appreciated.

dos mode is default if the stream isn't in binary mode. If the binary flag
isn't set the __stdio_text_read/__stdio_text_write functions are used for
reading/writing to the stream (see mintlib/stdio/sysd-stdio.c and
mintlib/stdio/internals.c, function __stdio_check_funcs).

Btw. in the current mintlib the stdin/stdout/stderr descriptors are in
binary mode by default for various reasons.

Source record: 662

Hi,

Some versions of PalmOS supports greyscale on mono LCD:s. I think this done
by toggling b/w at different frequencies to get different shades of grey.
(And / or some puls modulating)
This requires that the LCD is a bit slow, just like on the STacy.
On the palm, this looks great btw. You can't see the flashing at all.

Now, the problem is that I don't have a STacy, so I can't try this. But I
thought it would be a cool thing to do, perhaps by making a STacy-Greyscale
driver for fVDI or something..

Regards

/Peter

Well, it's a great idea of course, but I think greyscale is possible when
the machine
has a sufficient power capability to satisfact greyscale processing WITH all
global
taskes... This would require very optimised assembler routines I think.

Mathieu

>Can you send me a patch or explain what you did?

I've managed to go months without knowing anything about patches, so
rather than do a hurried read-up & make a complete mess of it, here's
the files I've changed. I'd imagine if cvs hasn't changed in the last
couple of weeks you'd be able to produce your own patch.

Things to look for are three tilda ~~~ which I often use to mark
changes (until I get too bored) and macros indented "strangely"
compared with the style used. In this case it looks like I've indented
them by one tab (eg options.h where's I've conditionalised some so
they can be affected from cygwin's config). Thinking of that just grep
for "cygwin" (insensitive) in configure and config.guess and you'll
find the changes to get the config found.

Once that's sorted the bash script "go" has the actual settings I last
used. Strangely the monitor used to work (when STonX didn't) and now
that STonX does the monitor doesn't! However, atm my working STonX
still has it configured in and built. Console info still appears -
you'll see a few 68k bus errors reported as it starts.

If there's anything else let me know. :-)

That's made it clearer thanks. I'd noticed the static stdin/out/err
definitions but kept thinking I might have missed something somewhere.

>Btw. in the current mintlib the stdin/stdout/stderr descriptors are in
>binary mode by default for various reasons.

I guess the solution is to check for UNIXMODE first then if it doesn't
exist change __binary according to the OS.

I delved into the "unreliable code" (bzip2 verbose output).
Embarassingly I'd neglected to turn binary mode off for stderr - which
is what bzip2's lib uses [Ahem].

Ugh - this one. I remember this one. They should have put this one out
of its misery years ago! You've no doubt realised the problem has got
little to do with plotting points, rather how to muck about getting
the console output in the right order. Split it into two, possibly
three parts. Obviously the top half is a mirror image of the bottom -
the possible third part being the zero point. You can't control 'X'
(y-lines on the console) so begin at "(11 - 1) / 2)", count down
through zero then back up to "(11-1)/2".

I'm not writing the code for you. This snippet of C++ is easily converted...

```
#include <cstdio>

namespace sd{typedef unsigned short uint16;}

static sd::uint16 d0,d1,d2,d7;

static void
out(void)
{
d2 = d1;

while (d2 > 0) {
putchar('.');
d2 -= 1;
}
putchar('*');
putchar('\n');
}

int
main()
{
d7 = 11;
d7 -= 1;
d7 >>= 1; //shift right one btw (ie d7/2)

d0 = d7;

while (d0) {
d1 = d0 * d0;
```

```
out();
d0 -= 1;
}

while (d0 <= d7) {
d1 = d0 * d0;
out();
d0 += 1;
}

return 0;
}
```

...actually I was going to post the 68k asm output from gcc with a comment to the effect "if you copy it they'll know". Unfortunately the code it generated was too close to the mark, so tough! ;-)

Hi again,

> Well, it's a great idea of course, but I think greyscale is possible when
> the machine
> has a sufficient power capability to satisfact greyscale processing WITH
all
> global
> taskes... This would require very optimised assembler routines I think.

Well, Yes - and No. If we use the colour-emulator approach, it will be quite slow. But if you implement a completely new graphicsmode with a new VDI driver for fVDI, it could be done pretty fast.

Lets say we use 4 copies of the screen in memory, and just toggle fast between them. As the ST has a "floating" videomemory, we don't need to copy anything to "refresh" the screen, so it would be very fast.

On a normal mono-monitor, this would give you migrane. On a slow LCD, it would give you shades of grey. (Provided that the toggling is done at a frequency that suits the LCD)

OK, this wouldn't give us 16 shades (2*2*2*2) like in "normal" colourmodes, but 4 (1+1+1+1).

I tried this on an old PC laptop the other day, and it works. Too bad I don't have a Stacy to try it on.

Regards

/Peter

I have not any either but anyway it looks like you could be interested
by this thread:
<http://groups.google.com/groups?hl=en&threadm=aa62ij%24kav%241%40nyheter.chalmers.se&rnum
=1&prev=/groups%3Fq%3Djohan%2Bklockars%2Bfvdi%2Bnative%26hl%3Den%26selm%3Daa62ij%2524kav%2
5241%2540nyheter.chalmers.se%26rnum%3D1>
(title is 'Re: fVDI and "native" drivers (Re: Dumb question maybe)' in
comp.sys.atari.st).

AFAIK as fVDI is modular (according to the docs), the only thing one
would have to do is to implement a few simple primitives ("put pixel",
"draw horizontal line", "draw vertical line", ... perhaps even only
"put pixel") and one would be done!
A good starting point for this would be the 4-plane driver but IIRC
but there are only 1, 4 and 8 plane drivers ATM... :-(

So please do some lobbying on Johan so that he makes drivers' source
code available! ;-)

Quite possibly.

>> Lets say we use 4 copies of the screen in memory, and just toggle fast
>> between them. As the ST has a "floating" videomemory, we don't need to copy
>> anything to "refresh" the screen, so it would be very fast.
>>
>> On a normal mono-monitor, this would give you migrane. On a slow LCD, it

Not necessarily. Take a look at the image processing/viewing program
MGIF (currently at v5.10 beta 5 [970707]), which can be found on my
Web site and elsewhere (I took over the development of MGIF in '92,
but have, unfortunately, not done anything with it for the past five
years). Its original purpose was exactly what you are talking about
- displaying stuff (well, images) in 'greyscale' on monochrome monitors -
and that functionality is still in there.

>> OK, this wouldn't give us 16 shades (2*2*2*2) like in "normal" colourmodes,
>> but 4 (1+1+1+1).

You only need to flicker between three screens to get 4 greyscales
(no set pixels, one set pixel, two set pixels, three set pixels).

Two screens would give you 3 greyscales, and four screens 5 greyscales.

The way to avoid migraine is to use some kind of dithering so that
the set pixels are evenly distributed among the flickering screens.
That is, a small 25% grey area could be built up of three screens
something like the following:

```
100 010 001
010 001 100
100 010 001
```

As you can see, a sequence of the three images would have every pixel
as 1 one time and as 0 two times, but unlike for

```
111 000 000
111 000 000
111 000 000
```

the timings would be evened out. The former case can look very good while the latter can indeed easily make your head hurt.

As I said earlier, take a look at MGIF.

>AFAIK as fVDI is modular (according to the docs), the only thing one >would have to do is to implement a few simple primitives ("put pixel", >"draw horizontal line", "draw vertical line", ... perhaps even only >"put pixel") and one would be done!

While this does not really have anything to do with modularity (it's simply a matter of the fVDI engine providing 'fall-back' functions that can do more complex operations using simpler primitives), it is indeed true. I have even written such a minimal driver for monochrome mode (the currently required functions are write_pixel, read_pixel, set_colours and get_colour (the latter two for palette handling)).

Horizontal and/or vertical lines are actually not primitives that are directly supported by fVDI. I know that many other graphics libraries have such, but I've never understood why (it's very simple to special case the handling of thin rectangles or general lines, which are much more useful primitives, at completely insignificant performance cost). That said, you could indeed implement only those special cases in an fVDI device driver and return more difficult lines/rectangles to the engine, if you wanted.

>A good starting point for this would be the 4-plane driver but IIRC

I don't really think so, since that one contains a lot of assembly code and is not particularly easy to understand. Also, the dithering that you would most likely want to use might be easier to do if you used some more fitting intermediate pixel format (for example, you might want to draw in byte per pixel mode and then convert larger blocks at a time for displaying).

>but there are only 1, 4 and 8 plane drivers ATM... :-(

There has never been a working 8 plane driver. The 2 plane one might have worked sometime at the beginning, but that was a long time ago. There is a 16 bit (word per pixel (FalconTC)) driver, though, that is almost 100% C code.

>So please do some lobbying on Johan so that he makes drivers' source >code available! ;-)

No need to do any lobbying for that. fVDI and most of its drivers are under the GNU GPL (This does not, for the time being, include the ATI RageII driver since it relies on information (and still, to a very small degree, source code) from ATI that is not publically available. Nor does it apply to the 16 bit driver sources, which are in the public domain (since that driver is intended as an example and I did not want to hinder any possible future commercial driver development). The sources for the 16 bit driver have been included in most real release archives, IIRC.).

Within the near future, I will have a CVS server up and running,
where the fVDI sources (among other things) will be publically
available (write access will be granted on a case by case basis).
The Linux server that will take care of the CVS is already working
fine (it is responsible for my recently resurrected Web site). I just
need to set up a few more things and move the CVS archive over from
my main PC.

I did just that (TT-Digger rules !) and it seems that a part of it is encrypted/compressed in some way...
But apparently all Fast-RAM init related code lies untouched at the beginning of the Flash code (which follows the standard TOS-executable format BTW).
I browsed through the memory test (interesting part :-)...) and it *seems* that a simple patch could be made to make a N-revision board work. But do not expect it to work on non N-releases then!

> > > Well if the memory-mapping is the only difference, perhaps some sort

> > > could do the trick!
> > > I will keep you informed of my "discoveries"...
>
> If I have some time this week I will try writing a simple FASTRAM.PRG
> program...

Tried to execute the following program at the beginning of the AUTO folder (I have a 32MB CT2B fitted:

```
pea superb(pc)
move #38,-(sp) ; SUPEXEC ($26)
trap #1 ; XBIOS
pea 32*1024*1024 ; 32MB
pea $04000000
move #20,-(sp) ; MADDALT ($14)
trap #1 ; GEMDOS
move d0,-(sp)
move #76,-(sp) ; PTERM ($4c)
```

```
trap #1 ; GEMDOS
superb:
sf $f7000000 ; 16/32MB SIMM CT2B (see CHPB)
rts
```

... and it bombed (very randomly) my Falcon to death... well, until the next reboot!

Any hints??? I cannot believe that programs (and TOS) could be *that* incompatible to a $04000000-starting Fast-RAM block...

I wondered if it is an XFRB/_FRB issue... As HD-Driver is started after my patch, it does not know about the Fast-RAM being available, so I guess it sets no XFRB cookie... As for the _FRB cookie, I wonder if it is useful on Falcon too (I have a SCSI drive attached)...

Perhaps there also are other Fast-RAM related issues I do not know of...

Mmmhmm... (Just though about it:) Perhaps the PMMU-tree is not properly set for >16M adresses... Will check that soon...

BTW the adress-bit #23 of $F6xx0000 seems to control whether one boots from Flash-memory or from ROM... So an emergency program to recover from a corrupt Flash code should be easy to write! :-)

Just a Reminder about Jagfest 2002 on july 12th and 13th in Saint Louis,MO:

Admission cost for this event is $25.00 for those who wish to pre- pay and $30.00 for those who wish pay at the door; this cost covers for both days.
Table prices are as follows (admission price is included): Visitor tables: $35.00 before July 9th (after July 9th its $40.00),
Dealer Tables: $45.00 before July 9th (after July 9th its $50.00) (extra tables are $5.00 each).

Also for those people who want to place an ad in the fest program here are the prices:
$15.00 for quarter page
$25.00 for half page
$50.00 for full page
A listing on the back page is under $15.00
For full details on how to place your ad in the program contact Greg George.
You can pay either by paypal (greg@ataritimes.com) or by sending a Check or Money Order to Gregoary D. George, 347 Banyan Drive, Winter Haven, FL 33884
Attn. Jagfest payments
For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com or Daniel Iacovelli at atarivideoclub@yahoo.com or visit the Jagfest 2002 site at http://omcgames.com/jagfest/
(be sure to visit the Jag fest message board and post your ideas for this event.)
---
like to help spread the word on Jagfest2k2 e-mail me (atarivideoclub@yahoo.com) ask about getting the Jagfest Flyer to pass out at your area.

5305. VDI color indices for 256 color mode ?

Newsgroup: comp.sys.atari.programmer
Date: 2002-05-27 06:24:56 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3CF1D138.40497090@siemens.at>
Source record: 674

Hi,

Can anybody tell me the color register indices for VDI for 256 color mode ? All the books I have only list indices for up to 16 colors since they obviously were written in pre Falcon times.
BTW, I always wondered what reason could be behind mixing the colors as it is done at outputs via VDI. Anyway It would be nice if somebody could help, and spare me the task of writing a test program to find out about VDI and 256 color mode indices.

Thanks
Gerhard

Hi,

> All the books I have only list indices for up to 16 colors
> since they obviously were written in pre Falcon times.

As far as I know there is no standard palette for 256 colors.
Atari never defined something like "VDI color 154 is light red
(=red 900, green 700, blue 700)".
So you can't assume that an index has the color representation
which it has on your Falcon. But I think most of the people
use the standard palette if the Atari VDI or the new (better)
palette from NVDI.

I think Atari defined only the first 16 colors because the user
interface (=GEM) only uses the first 16 colors. The other 246
colors can be changed by the applications.
This approach gives us a strange looking screen in a multitasking
environment in which more than one program uses more than 256
colors. (=the windows in the background use also the current
palette in the 256 color mode)
So it's not "nice".

Regards
Philipp

Sorry, it seems I didn't make my problem clear enough. My problem is not about the RGB values of certain VDI color indices but the shifting of color indices VDI (and NVDI too) does. For example when I make my program read a picture with 16 colors and display it on screen, when using VDI functions to set the colors according to the picture palette, I have to use a color index different from the index in the picture palette, using certain rules that can be found in books like e.g. the Atari Compendium etc., e.g. 2->3, 15->13 etc. to get the right colors on screen. Now for 256 color pictures these color index shifting rules seem to be similar than for 16 colors but not exactly the same. Color indices from 16 to 254 seem to be identical in picture and VDI palette but at least index 255 has to be changed (to 1 ?) which causes changes in the others between 0 and 15.

regards
Gerhard

I have this table in the ximgload.c file in boinkout2's source code.

The short answer is it's 1 to 1 excet for the changes for 16 color modes and
1 = 255
255 = 15

so it's
0,255,1,2,4,6,3,5,7,8,9,10,12,14,11,13,16,17,18,19,20....
...251,252,253,254,15

So that's why the games I wrote before seemed to work okay when I
used the same changes as for 16 color mode.

Many thanks
Gerhard

hmmm... Does anyone have a clean routine, wich loads ximg files to a
memory-block, so that I just have to blit it
on the screen? (I code in Gfa-Basic, a inline would be the best)

Would be great, because the file format is very hard to understand...

Aah! : And what's about the efm-modules, which comes whith papyrus? (And an
old grafik-program called 'True Paint' use it too)
And why is it not easy to find routines for ximg-files? I think its the
atari-standard graphik file format...

Thanks

Emanuel

Jagfest 2002 Goes to New Dimensions

For Immediate Release:

June 1st, 2002

(St. Louis, MO.)-- In what could be considered an unprecedented move, the organizers of The Sixth Annual Atari Jaguar Festival have decided to broaden the scope of the event by showcasing not only the Atari Jaguar, but classic and next generation systems. Adding to this, Jagfest 2k2 will also provide an avenue for creators of "homebrew" software to show their creations to the world. Last years Jagfest in Milwaukee, Wisconsin set the stage by allowing non Atari systems to have a limited presence. This year that idea will be taken further by making their inclusion official.

James Garvin, owner of OMC Games and a principal organizer of this year's Jagfest, states: "Jagfest symbolizes what can happen when a group of gamers actually care about their games, and it has survived this long because of dedication from its community. Our goal is to insure that Jagfest will survive for years to come, and to do this the concept of what Jagfest stands for can be expanded to include gaming in general. The "Jag" in Jagfest won't be lost, though. It will still retain a major presence in the show, but gamers of all types should be able to share some of the same heritage that has kept the Jaguar alive after all of these years. This change is just a natural progression of the show."

Daniel Iacovelli, Founder and President of The Atari Video Club and co-organizer of this year's Jagfest also states:" The addition of old school and next generation will add a new dimension to the event. My club has seen the progression of this event since its start in 1997, from just Atari Jaguar and Lynx being shown at the first event to the addition of classic systems shown at the last year's event, it just seemed natural to continue from that plus extending it to new dimensions".

The Sixth Annual Atari Jaguar Festival (dubbed Jagfest 2k2) is being held in downtown St. Louis, Missouri at The Mayfair Wyndham Historic Hotel. (806 St. Charles Street St. Louis, Missouri 63101. Phone: 314-421-2500) on Friday, July 12th and Saturday, July 13th 2002.

For more information On Jag fest 2k2 e-mail Greg George at greg@ataritimes.com, James Garvin at omc@omcgames.com ,Daniel Iacovelli at atarivideoclub@yahoo.com or JT August at starsabre@worldnet.att.net visit the Jagfest 2002 site at http://omcgames.com/jagfest

(be sure to visit the Jag fest message board and post your ideas for this event.)

i am in dire need. not quite life dependant but close need for the
inter/lisp-65
package that was produced by datasoft in conoga park. there is a cd produced
by a man who's name sounds like sympothy whine and he is to be assosiated with
a great fire y bird that is a symbol of change. this cd this thief man
produces has a small amount of the package on it, but due too the dishonest and
chicken hit way he conducts himself in what i hope is an attempt to be a man,
though he is so far off i am not sure he intends or portends to be a man, i
will not utilize this grown childs resource. i do not find it easy to benifit
from the work of a criminal.
i have a very complete.. very complete atari collection...(this is due, nearly
entirely, to another mans infinite generosity) so i have some very very good
items to barter with. items that are not up my alley but might be a concrete
definition to another Atari user. i would like to stoke out the person who
could find me this lisp implimentation in completeness. it is disk based and
has nice books that are part of the package and intigral to understanding the
atari lisp subset.

so far in these monthes i have sought to procure this software package i have
not hit any good luck. it exists and michael (small fruit, i believe similar
to a cranberry but also what exists as dangerouse in moving water) lightly
details it in the nice 8-bit faq he so nicely maintains.

lisp is the jist at least in my world right now. i have it on this pc but i
would love to be programming in lisp on my favorite platform even though it is
a mere subset.
interlisp/65 for our machine is comprehensive enough for some nice programming.
somebody, if possible, help me get this and i believe i can return in
gratitude some software equally desired by WHOEVER can get me lisp. i have an
impressive amount of software all complete or nearly complete and in good
condition. i may be persuaded to trade a complete original good condition
fully functional MULE package for it. MAY BE ABLE.... someone talk to me ..i
can make it cool for the one who can produce it.

June 4th, 2002 - Midwest Classic Host Large Display of Vintage Computers

Let the Midwest Classic take you back to the glory days of personal computers, when people had choices beyond a Windows or Macintosh based computer. Sponsored in conjunction with the Classic Gaming Museum, the Classic Computing Museum features a large display of 8 bit and 16 bit computers from the industry's beginnings in 1975 through to the last days of the 16 bit computers in the early 90's.

Of special note this year is a large section devoted entirely to Atari computers, and will include many hard to find Atari peripherals in their pristine condition. Visitors will also have the opportunity to leave their mark on this historical event by stopping by at the Atari 400 Guest Station, where they can enter their name and a personal saying for other visitors to read.

The Classic Computing Museum will have a large selection of items on display for visitors to see, learn about and play. Each display will contain a small description and history of the items in the display. Not all items on display will be playable. Classic computing expert and ClassicGaming.Com editor Marty Goldberg will be on hand to answer visitors questions and guide them down memory lane.

"I look forward to exposing people to a rich and vibrant history they may not be aware of." said Marty. "Likewise," he continued, "those who are old hats to the subject will be pleasantly surprised as well by the extent of the display. Definitely something for everyone."

More information about the Midwest Classic may be found at the Official Midwest Classic Web site at the GOAT Store, LLC (http://www.goatstore.com). Dan Loosen can be reached at loosen@goatstore.com and Gary Heil can be reached at heil@goatstore.com for more information on the event.

No they havent, asshole!!.

No need, here in france, regular backups of IPS are enough.

> They can recover from your PC every single picture or item you have
> ever watched on the Internet.
No you cant.

Sorry, they can retrieve any information after 4 hd low level format. They uses
kind of oscilloscope and frequency sorter.

> You need protection. You need an Evidence Eliminator.
Is there an Atari version, arsehole!.

Even the pc version is an illusion because of isp backups and police tools.
Fortunately regular porn isn't illegal.

Hi!

I've been using about two scheme implementations during my studies.
I'm sure you can find some other lisp engines out there. Maybe you can
just try to compile some free sources. I'm pretty sure that a port of
this would be quite easy.

regards

STan

Well if you know how to use XBIOS you are (almost) done.
See: http://www.mbernstein.de/atari/prog/tos/xbios/0a.htm (very good
docs I think)
It is in German so if you have translation problems do tell me or ask
the author to do an English (or French) version!

> I'm beginning to programm in 68060 and need to drive a CD audio.

Mhhmm... Think you had better code for 680x0 before using pipeline and
reordering tricks! Anyway MetaDOS sure does not benefit from this...
BTW how is your game going? Raytraced images are nice but I would be
very pleased to see something more... concrete! ;-)

Hello Guillaume,

(Puisque c'est un forum public je vais donc te r&#65533;pondre en Anglais)

&#65533;> Does some of you knows to use m&#65533;tados from gfa or assembler ?
&#65533;Well if you know how to use XBIOS you are (almost) done.

Need to know the functions numbers and the parameters !

&#65533;See: http://www.mbernstein.de/atari/prog/tos/xbios/0a.htm (very good
&#65533;docs I think)

I will look, thanks.

&#65533;It is in German so if you have translation problems do tell me or ask
&#65533;the author to do an English (or French) version!

It will be a good way to improve my German.

&#65533;Mhhmm... Think you had better code for 680x0 before using pipeline and
&#65533;reordering tricks!

You maybe right, but I like to start straight on in the difficult and learn why things have to be done in a way rather than another one.

I'm nearly finishing a bloc move routine using 68040/60 functions and it should be rather fast.

>Anyway MetaDOS sure does not benefit from this...
&#65533;BTW how is your game going? Raytraced images are nice but I would be
&#65533;very pleased to see something more... concrete! ;-)

M&#65533;tados won't benefic of it but all time spared will b&#65533;n&#65533;fit to the game.

The game progressed regularely but is now like a BIG (300 Mo) puzzle game :
Music intro in 44100 Hz 16 bit st&#65533;r&#65533;o, sounds effect same quality, 80 Mo of raytraced images.
What's missing : sounds wait to be driven by M&#65533;tados, and intro images wait to find a programm that can turn 640x200x256c pictures into a flh (programm not yet found). If I can't get it we'll do all by ourself as a good coder joined us and is making a programm to turn graphic card images into f30/TT screen compatible.

As it was NO st user feed back we abandonned the ST version.

When some 'concrete' things will be ready (i.e. the intro) it will be an add on the home page of our site (http://yves.rogne.free.fr/images) but it can only be send via CD (for FREE of course).

Contact us as you want at jeu.tos@online.fr.ARETIRER

Regards

M&#65533;gamodeste

For assembling pictures into an FLH, all you need is here:
http://perso.club-internet.fr/vanel/flxwork.htm
(Well only TGA/TG1 is supported but no big deal I think, use XnView's
converter if needed.)

> Contact us as you want at jeu.tos@online.fr.ARETIRER

For all non-French people out there: jeu.tos@online.fr.REMOVETHAT :-)
Mhhmm, IMHO this type of fake adress should be quite easy for spam
bots to remove anyway...

Salut Guillaume,

> I'm nearly finishing a bloc move routine using 68040/60 functions and it
> should be rather fast.
move16, eh?

You won !

I think this doc will also be useful to you:
ftp://ftp.uni-muenster.de/pub/atari/Programming/cdbind01.zoo
(In C but you should figure it you easily anyway.)

I will try, ne not sure to understand it : I know GFA, I beginn in assembler
and that's enough for me.

For assembling pictures into an FLH, all you need is here:
http://perso.club-internet.fr/vanel/flxwork.htm

I tried it (and will try again) but even if it is written that it is free now I
experienced shareware restrictions)-:

> Contact us as you want at jeu.tos@online.fr.ARETIRER
For all non-French people out there: jeu.tos@online.fr.REMOVETHAT :-)
Mhhmm, IMHO this type of fake adress should be quite easy for spam
bots to remove anyway...

Sure, its why I wrote ARETIRER instead of removethat (-;

Sponsors announced for Jagfest 2002

For Immediate Release:
June 14, 2002

The organizers of The Sixth Annual Jaguar Festival (dubbed Jag fest 2k2) are pleased to announce
the current line of sponsors:

Atari Jaguar Directory:
an online directory listing of Atari Jaguar owners from around the world. E-mail: Randy@atarijaguar.net
Website:http://atarijaguardirectory.com

The Game Trader:
A St. Louis area video game dealer that sells classic and contemporary consoles and games. Located in St. Charles, Mo., at 2 Hawks Nest Plaza.
Directions: Directions: I-70 to Highway 94, south to the South Outer Road. Turn right (west), go one half mile from 94 to Hawks Nest Plaza at the Hawks Nest Drive overpass. Phone:1-636-723-0072.

Good Deal Games:
An online video game retailer that provides games for classic and orphaned systems. Their website also provides information on video gaming past.
Michael Thomasson, President
Website: http://www.gooddealgames.com

Songbird Productions:
An online video game retailer and developer of Atari Jaguar and Lynx games. Their store also hosted the third Jagfest in MN.
Carl Forhan, President
Website: http://www.songbird.atari.net

Telegames:
An online retailer and direct mail of video games for various game systems. They also develop Atari games for the Jaguar and Lynx like Zero 5, Breakout 2k and Worms for the Jaguar and Dessert Strike for the Lynx. Telegames was also one of the first sponsors of Jag fest.
Address: Telegames, PO box 1855, Desoto, TX 75123
Phone: 1-972-228-0690 E-mail: Sales@telegames.com
Website: http://www.telegames.com

Trade n Games
1057a Gravois Road, Fenton MO. 1-636-349-3113. Trade n Games is

located on the bluffs off Gravois (the s is silent) overlooking
Fenton, Mo. Reseller of video games from Pong to Gamecube.

If you represent a business that would benefit from advertising in the
Jagfest program or appearing
in the festival's dealer room to sell your product or offer live
demonstration,
e-mail Greg George at greg@ataritimes.com or
JT August at starsabre@att.net for additional details and a pricing
schedule.

For more information On Jag fest 2k2 e-mail Greg George at

Folks,

I know this is probably a stupid question, but it is late and my brain has completley siezed up.

I am using the old GULAM shell and an old GCC (2.1.2) on my STE with TOS 1.6. I have copied some code from elsewhere. It "Makes" fine on my PC under CYGWIN with the latest GCC but on the ST it won't as it says the command line is too long. Are there any work arounds for this, or will I have to put some of the defines into a ".h" first?

Thanks in advance,

Dave

I won't help you a lot but is your programm made for plain Tos or Mint ? If Mint long filenames are ok.

By the way, there maybe some interesting things for you (gcc last release and free libraries to compile for any Atari, including 68060) at http://olivier.landemarre.free.fr

Its not the file names that are too long. Make just builds a very long
command line with many
"-D" entries which I guess should really be in something called "config.h"
or similar and we should
have a "make config" to set it up.

Hi Dave,

Its not the file names that are too long. Make just builds a very long
command line with many
"-D" entries which I guess should really be in something called "config.h"
or similar and we should have a "make config" to set it up.

I just remember that when I have to pass long command lines to a .ttp I just run Gemini (v2 ?).

Regards

I will try that. Just don't have the GCC environment set up in GEMINI...

I checked : I have 1,a 29/1/1995 modified for 68040 (by me).
Sorry.

Well it's about ten times more messages than usual in this ng ! (-;

Regards

If you're lucky (all the -D entries must be the same) then "make -n
>foo" on CygWin will give you a file from which a config.h can be
built from. Amazingly (I can't even usually manage this much) this
snippet may then be useful. From CygWin bash (all one line not wrapped
like here)...

for i in `cat foo`; do echo $i | sed -e 's/-D/#define /' -e 's/=/ /'
-e 's/-.*//'; done

...which should change all your -D arguments into #define's and remove
all the switches. There'll be some other junk (filenames for sure)
that have to be cut manually. Sorry about that - couldn't figure out

how to get shot of those without mangling the #define's.

More long term solution might be the CygWin m68k cross-compiler. Bah -
can't find the link. I'm as tired as you were! Look back through this
group and you'll find it. ;-)

I am not sure that this will work as the makefile is a real mess. (and of
course I need different arguments for TOS as for cygwin.) In fact I can
dispense with most of the "-D"s as they turn on options which are not
supported in TOS, and I can now comiple about 50% of the code.

This is a GREAT idea! This should remove the filenames too:

for i in `cat foo`; do \
echo $i | sed -e 's/-D/#define /;/[^#]/d;s/=/ /'; \
done

laurent.
```

I don't think that won't work as we have lots of things like :-

PRINTDIR = /tmp
DPRINT = -DPRINTDIR=\"$(PRINTDIR)/\"

in the makefile. Any way I am now switching to Mint as some other libs
are need are only in Mint. Will let you know how I get on...

Dave.

Why are you posting anonymously? and why are you calling a dead common modem
as "rare". those were built in the thousands, they're far from "RARE".

then this?

```
for i in `cat foo`; do \
echo $i | sed -e 's/-D/#define /;/[^#]/d;s/=/ /;s/\\"/"/g'; \
done
```

(just joking. use MiNT.)

Laurent.

Now have working Mint. Which editor and shell ?
I think EMACS for the editor ?
But a shell, I don't like BASH ? what about plain old SH ?
Any idea where to get,

Okidoki. You've probably completed it by now but just in case, perhaps
you missed my mention of "make -n"? The above wants applying to the
"make -n" output not the makefile itself. ;-)

Good Luck!

5347. Budding programmer newbie?

Newsgroup: comp.sys.atari.programmer
Date: 2002-06-22 05:35:12 UTC
From: puffpuffin@aol.com
Message-ID: <70527180.0206212135.1d6701b2@posting.google.com>
Source record: 616

Hi everyone,

I've been a longtime Atari user and have been an Atari ST user since 1987. I never got into programming because I could never do complex programs in Atari Basic for the 8-bit machines. The best I could do was using some variables with IF...THEN loops, PLOT, DRAWTO graphics commands, and then copied bits of programs from type-in programs in magazines such as COMPUTE!, Antic, etc. to see what each chunk of code did. Problem was that I couldn't understand these chunks of code. :-(I took a FORTRAN class in college and squeaked out a 'C' grade. And since there were a good number of ST programs, I never really had an itch to get into programming.

Fast forward to now, there seem to be fewer ST programmers than ever. I feel like making a contribution to the ST community, but my past programming experience has made me think twice about the headaches involved in debugging. (That's why I didn't do well in FORTRAN - my program looked like it's suppose to work, but it didn't and I could not find the bugs before the assignment was due) *End of life story* :-)

With this background, is there any hope for me getting into programming?

I'd probably want to start in BASIC again, but which is better and has more resources, sample commented code and tutorials - Hisoft or GFA?

Feedback is apprciated.

Thanks, Phil

Hi,

For BASIC GFA is only real choice.. It is very powerfull, compiler
is very good too, docs are there and not last, there is bunch of GFA
programmers as well...

SWE

Hello,

With this background, is there any hope for me getting into
programming?
I'd probably want to start in BASIC again, but which is better and has
more resources, sample commented code and tutorials - Hisoft or GFA?

GFA !
We do a game in compiled GFA with some assembly routines.

Try GFA, it isn't that much complex, and less than Fortran.

Regards

I don't understand what your problem is.

Here is a sample Makefile fragment.
It is extracted from the EmuTOS Makefile which can be browsed at:

http://cvs.sourceforge.net/cgi-bin/viewcvs.cgi/emutos/emutos/Makefile

Laurent.

Laurent,
Sorry, not even tried make just did :-

$ m68k-atari-mint-gcc hello.c -o hello.ttp
Assembler messages:
for reading.open
: No such file or directory

If I do a "gcc -v" it is calling the correct assembler. Any hints ?

Dave

Maybe. 'makefile' variables?

<side-issue>
Lest I forget (I assumed it was my fault) - iirc just a single library
(maybe libm.a but not certain) managed to "escape" from

/lib/gcc-lib/m68k-atari-mint/2.95.3/m68020-60...

and made an appearance as /lib/libm.a (replacing the cygwin/gcc one)
thereby causing some strange errors. I mention this just in case you
want to check your /lib/libm.a timestamp.
</side-issue>

I did have an initial compilation problem. No idea what it was though,
except once located, trivial to fix. Sorry! Might have been 'specs'
(compare attachment against yours).

I remember being in here: it may be just that, a memory, and nothing
wrong at all. Just in case...

J:\cygwin\bin\m68k-atari-mint-unprotoize.exe
J:\cygwin\bin\m68k-atari-mint-ar.exe

J:\cygwin\all\bin\m68-strings.lnk
J:\cygwin\all\bin\m68-strip.lnk
J:\cygwin\all\bin\m68-addr2line.lnk
```

...read each one as (for example)...

```
ln -s /bin/m68k-atari-mint-ar.exe /all/bin/m68-ar
```

...note that "/all/bin" is a red herring. I just happen to have "/all/bin" in $PATH so as not to pollute /usr/local/bin with all [sic] my junk!

Okay. Here's the reason for all the waffle about the links - so that what follows makes sense. <G> I'm making the assumption the assembler does work manually but not in a "makefile" situation. Here's a "template"...

```
CC =m68-gcc
CXX =m68-g++
AR =m68-ar
LD =m68-ld
STRIP =m68-strip
RANLIB =m68-ranlib
NM =m68-nm
AS =m68-as
```

```
INC +=-I.

DBG =-fno-builtin -g -DDEBUG
WRN =-ansi -pedantic
#-fno-implicit-templates
EEK =-fhonor-std -Weffc++

CFLAGS =-Wall $(DBG) $(WRN) $(INC)
LDPATH =
LDFLAGS =-lSd -lstdc++

CXXFLAGS =$(CFLAGS)

.PHONY: all

NAM =c
EXE =$(NAM).prg
OBJ =$(NAM).o
DST =/cygdrive/j/mpc/f

$(EXE): $(OBJ)
$(CXX) -o $(EXE) $(OBJ) $(LDPATH) $(LDFLAGS)

all: $(EXE)

install: all
cp -v $(EXE) $(DST)/$(EXE)
chmod 777 $(DST)/$(EXE)
$(STRIP) $(DST)/$(EXE)

uninstall:
rm -v $(DST)/$(EXE)

clean:
rm -vf $(OBJ) $(EXE) *~
```

...(also attached as "makefile.g++2.m68k"). If none of this helps fix things then post some detailed info and I'm sure we'll figure it out eventually.

PS: I can't see that it matters but the above is
CYGWIN=binmode ntsec
on NT Wks SP6a RC1.28

I havent tried hisoft or gfa basics yet but I hear GFA seems to be a bit more popular. C is another popular choice on the ST. Theres even a shareware fortran called "bc fortran" as well.

Really?! Ok, then. Are there any good books/tutorials that are online (I doubt there are any in print, correct?) that I can check out?

I have a bunch of old Atari Computing magazines that have tutorials on HiSoft BASIC. Would any of it help?

While looking through those magazines, I saw a package called Enchant, which includes a whole bunch of sample code with everything from printing with NVDI to Y2K fix. Is there an equivalent package for GFA Basic? I'd like to take advantage of the latest protocols such as non-modal boxes, radio buttons and such.

Finally, what's the latest version of GFA Basic? (IIRC, it's 3.6e?) I have an old version 3.0 package with manual and disks. Will this do? If not, how can I upgrade?

Thanks for your input!
Phil

�Really?! Ok, then. Are there any good books/tutorials that are
�online (I doubt there are any in print, correct?) that I can check out?

I saw a 'your second hand gfa manual' somewhere, maybe on Chapelie
(193.190.204.128) but I know that www.gfa.net may exist.
There are a lot of gfa site, but as the more active programmers are German some
home page are in German. Don't worry, all doc they provide are in German and
English.

�I have a bunch of old Atari Computing magazines that have tutorials on
�HiSoft BASIC. Would any of it help?

No

�While looking through those magazines, I saw a package called Enchant,
�which includes a whole bunch of sample code with everything from
�printing with NVDI to Y2K fix. Is there an equivalent package for GFA
�Basic? I'd like to take advantage of the latest protocols such as
�non-modal boxes, radio buttons and such.

Don't know

�Finally, what's the latest version of GFA Basic? (IIRC, it's 3.6e?)

I use 3,6, don't know what is the 'e' for.
I read a th�orical 3,7 but never read more.

�I have an old version 3.0 package with manual and disks. Will this
�do? If not, how can I upgrade?

3,0 is good. 3,6 include TT sp�cific functions.

If necessary, you can reach me at yves.rogne@free.fr

If you want a simple way to make modern looking applictions in GFA BASIC
take a look at Face Value. I think it is still supported but newer
versions are German only and it is commercial. Sorry no link to offer
right now...

Face Value will give you a sort of "Visual Basic" environment where you
don't have to do any of the hard work yourself to write GUI programs with
all sorts of buttons, popups, windows, etc..

>Finally, what's the latest version of GFA Basic? (IIRC, it's 3.6e?)

Yes. but you should upgrade/patch the compiler libraries anyway.

>I have an old version 3.0 package with manual and disks. Will this
>do? If not, how can I upgrade?

I guess it's OK. There were some matrice functions etc added to the 3.5
but at least my manual is still for 3.0 . 3.6 is 3.5 with some fixes in
the editor so it runs better on a TT.

You might take a look at what bugs were fixed after 3.0 and try to avoid
these when still using 3.0 .

I use GFA myself. Once purchased HiSoft basic and ended up re-selling. There is various resources for both, docs and the like. I found the HiSoft editor to be a pain. That's just my opinion though. Still using GFA.

You can find some GFA-Basic related stuff at my site:
http://www.q1.net/~atari/

could you show the output of the gcc -v command?
by running the connads manually (step by step what gcc -v tells),
is the assembler file generated correctly?
do you have a space in you TEMP directory pathname?
are your disks mounted in binary mode?

Apart from these I don"t have a clue.

Laurent.

Could try CygWin source - they use 'ash' as 'sh'. It won't
cross-compile OOTB (I just spent 30 seconds trying) but after 30
minutes of adding __MINT__ into conditionals I got it launched into
VT52 under MagiCPC - I am truly f..f.. [cough] *amazed*.

Drat. I hoped I'd be okay uu-encoding them into the body. I emailed
"specs" to Dave and apparently the problem has gone away.

I imagine you never got my STonX changes either. Did you get it
working? I should still be able to dig those out.

Guys,
I think I have found my problem with the cross compiler. I had unpacked it using Windows utilities. If I unpack it from the command line in CYGWIN it all seems to work o.k. At least I can compile and run a simple "C" program without messing around.
Dave.

> I got some exemple in C but don't know that language.

Just post it (or an excerpt if it is too long) here as someone (me ?)
could surely translate it to you.

5371. Text extraction utility

Newsgroup: comp.sys.atari.programmer
Date: 2002-07-02 11:09:58 UTC
From: <>
Message-ID: <1025603536-908681AEicMi@ntlworld.com>
Source record: 640

HI all,

DDP Translations has need of a utility that will extract text from a binary to the screen and/or text file, and after editing/translating it, patch the binary with the new text.

TTPs are no problem, and we'd like to be able to include it alongside the patch text for any future DDP Translations releases.

At the moment we're using a utility written by Richard Faika, but it will only extract text from the data section of a program, sadly not all programmers have compiled their programs in this way :-(

Anyone up for this?

Cheers

Derryck

> At the moment we're using a utility written by Richard Faika, but it will
> only extract text from the data section of a program, sadly not all
> programmers have compiled their programs in this way :-(

Does RGFs utility allow to replace the extracted text areas by longer
ones?

If yes, his utility will have to scan the code segment and patch it so
that changed addresses within the data segment will cause no problems.
(This is the hardest part to implement at least.)

If not, everything is easier. Extracting and patching text from the whole
program code should be no problem then. Ask Richard to change his utility.
If he says no, I would write such a utility for you.

Greetings,

Alexander Beuscher

For the extraction part, the program 'strings' (from the 'binutils'
package of any MiNT or Linux-like distribution(*)) would do the job
for the extraction part, provided you use the options to scan the
entire executable (-a) and print offsets (-t <base>).

(*) You can also find it here (according to Julian F. Reschke's
homepage):
<ftp://ftp.uni-muenster.de/pub/atari/Gemini/mupftl14.tos>

> TTPs are no problem, and we'd like to be able to include it alongside the

Nice idea!

> At the moment we're using a utility written by Richard Faika, but it will

Sure Richard could do the patch part? (Better use hexadecimal offset
output (-t x) as it is easier to parse!)

Another possibility is to ask Vassilis Papathanassiou to do a
PRG_TRANS, as its RSC_TRANS is quite nice!

No, it truncates any text that is longer than the original (it also pads
text that is shorter with spaces).

>If yes, his utility will have to scan the code segment and patch it so
>that changed addresses within the data segment will cause no problems.

I guess that this wouldn't work if the utility was to check the whole of the
program since there would be jump tables and etc involved (I'm out of my
depth here as I'm no programmer!).

>If not, everything is easier. Extracting and patching text from the whole
>program code should be no problem then. Ask Richard to change his utility.

We've asked Richard a few times now but he's said that he's too busy which I
respect, despite our need!

>If he says no, I would write such a utility for you.

That would be most excellent :-)

As a first step, I've emailed you Richard's utility (I've already asked
permission to include it with our patch texts, so there should be no
problem) so you can see the sort of thing. Please tell me if you don't recieve
it when you read this.

Cheers!

5377. STOS Basic - Screen as a String

Newsgroup: comp.sys.atari.programmer
Date: 2002-07-04 07:32:03 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <ag0tjv$e46$1@pegasus.csx.cam.ac.uk>
Source record: 646
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

I'm trying to write my first STOS 3D game and am having trouble with the intro screen, I thought that one method of solving it might be to take several snapshots (about 30) of the screen and store them as strings (either in a file or bank) so that they can be loaded and then dispalyed in sequence like the frames of a film to produce an animation.

So does anyone know how to store and retrieve serveral stings from one file/bank?, also would each string stored need a different name to be able to recover them?
Alternatively does anyone know how to get STOS to run IFF animations created by Delux Paint?.

While I have the attention of any STOS users who may still be out there do you know of any active STOS users groups/mailing lists as the list at Manchester University which had about 20 subscribers has closed. I know it did not recieve a lot of postings but I was nice to have a place to go if you needed help and advice.

Stephen Moss

Is MiNT the issue? See the (*) "footnote", the auto-extracting archive
contains a file "strings.ttp" that AFAIK works under plain TOS or
MagiC too...
```

One extra line is needed in the header and can look like this:
Disposition-Notification-To: =?iso-8859-1?Q?Erik_H=E4ll?= <erik.hall@affv.nu>

MyMAIL supports reciepts.
can be found under
http://212.214.15.116/~erikhall/mymail.html

Extracting strings is one thing (I can do this with Look'n'See), but there must
also be a solution for "posting" text back in.

Cheers

Thanks for the link I will check it out, I actually managed to sort of
achieve what I was trying to at the weekend by saving the images to a
sequential file and then loading them from the file into data
elements. Damn it displays them quickly on a Falcon, the only draw
back was that for the 10 frames I tried the file was over 1 meg and I
really need 30 frames!.
I will check out the info in stosser, I'm sure thats a better method
unless I can find another way of doing it.

> able to recover them?

I'm a little rusty but will try to help you. If you just want to store images in a bank then I think the missing link extension allows you to store more than 1 image in a bank and recover it. If you want to put it in there yourself then you want something like..

```
reserve as data 10,32768*5 ( 5 full screen images )
load "pic1.pi1",start(10)
load "pic2.pi1",start(10)+32768
load "pic3.pi1",start(10)+32768*2
load "pic4.pi1",start(10)+32768*3
load "pic5.pi1",start(10)+32768*4
```

then all 5 pics will be in bank 10. then all you need to do is use COPY to copy the block back from the bank to the logical screen. The missing link has a much better version of COPY (i think).....you would use something like....

```
copy start(10)+(32768*PICNUM),logic
```

I can;t remember the syntax offhand, screencopy *should* also work since you are storing valid image data in a bank. PICNUM is the number of the pic you want to display on screen.

Once you get the hang of that idea you can then use the STOS Squasher or even Atomic to compress them and store them in compressed form in the banks to save space ;) I wouldn't use the screen banks to store images, its a bit limiting really, but fine if you only want a few images.

> Alternatively does anyone know how to get STOS to run IFF animations
> created by Delux Paint?.

erm, I think there was, I would check out STOSSER im sure its in there
somewhere!

Hey everyone,

Octopus is a PureC project and so it compiles under PureC. The dilemma starts with the fact that after implementing STiNG support, I now want to implement mintnet sockets support. Which is all good and great but that would require getting the project to compile under GCC. I think that is probably a rediculously daunting task, however I think the alternative of getting it to compile under purec with the mintlib headers and libs would be easier. Any ideas on how to do this?

thanks
Mark

Going from gcc to PureC can be a bit tough, since it's not always easy
to get things to work with 16 bit integers if you started out with
32 bit ones. Also, if you happened to use any gcc specific features,
those are most likely not available in PureC.

The other way around is a lot easier, especially since gcc can be told
to use 16 bit integers using a command line switch (at least the
versions I have used supported that, but newer ports may have removed
the possibility) if you want to.

You may need to use a few different include files and add some #if
here and there, but unless you have used something strange in the
libraries, I don't think you'll have much trouble.

I usually make my software (including MGIF, which is about 1 Mbyte
(mostly C) source code (probably 50k lines or so), and fVDI (for which
the assembly files still don't work with gcc, so I'm not 100% sure that
the C code compiles correctly with it yet) which is of similar size
(but with a much larger percentage of assembly)) compile under all of
PureC, Lattice C and gcc, and seldom run into any problems.
When I do, it's because of those silly 16 bit integers.

The size of the type (int) itself can easily be worked around using
'long' where appropriate, but some constructs in the C language (at
least in PureC, I haven't checked the standard) can be troublesome
since they only work with 'int'. This seems to be the case with
'switch' and possibly array indexing (not sure about the latter, but
I seem to recall having some trouble with that earlier), for example.
Since your code starts out working under PureC, those problems should
not affect you.

Anyway, gcc is a much better compiler, so you're better off with it,
if you can take the compilation speed hit (can easily be ten times or
more slower than PureC).
The compilation speed is one good reason to make your code compile
with different compilers. Another is that different compilers tend

to catch different problems in the code (if you have access to
something like 'lint', that is of course much better still, though).

5391. Help needed for driving audio cd

Newsgroup: comp.sys.atari.programmer
Date: 2002-07-12 11:58:29 UTC
From: anti.spam@nullepart.gouv
Message-ID: <3d2ec464$0$454$626a54ce@news.free.fr>
Source record: 710

Hello everybody,

After vain tries, I call again for help :

We make a game : graphics and separate audio. Audio part had to be played via the CD.

We found some CD instructions but in C, and we understant only Gfa and assembler

Can anybody tell us how to send 'play track X', 'pause', 'stop', and adjust sound level (optionaly left and right if possible) via gfa or assembler ?

Regards

Yes, lots but none are particularly satisfactory.

a)
Locate an existing PureC port of the mintnet libs. I assume none exist
otherwise you would not have posted.

b)
Produce a PureC port yourself. If my assumption (a) is correct then it
will be reasonable to conclude that attempting to do so will require
substantial effort.

c)
Port a subset. You can get a good idea of what will be involved by
putting all the required calls into a gcc test app and getting the
linker to fail. Just list the calls - they don't have to make sense
but don't omit one because if you later need it the whole thing could
mushroom out of control. Once it compiles and links cleanly, remove
the mint libs for which no PureC equivilent exists. The resultant
undefined labels will be pretty much what you will have to port to
PureC. Whilst the amount of (mint) socket code (to be compiled by
PureC) is an issue, the crux between feasibility and impossibility
lies here...

I would imagine those undefined labels will go pretty "deep" into mint
itself which is exactly what you *dont* want to discover. If this is
the case then all you can hope for is those "deep" mint calls manifest
themselves as traps - those being trivial to implement.

d)
Find a tool which can produce a PureC lib from a gcc one. Again, if
one exists, it would be a stopgap measure: you at least would
absolutely require source code for it (if for nothing else but to keep
that tool working if the gcc format changes).

e)
Write a separate gcc app to hold the mintnet code. Have octopus(PureC)
talk to it in some fashion - perhaps via a pipe.

f)
There's a STiNG "thingy-wotsit" (?gluestik?) for mint isn't there? I
assume that idea has been dismissed.

I agree with Johan - port it to gcc. I might even be able to offer a
helping hand in that respect but...

>thanks
>Mark
>http://atari-source.com

...I just discovered the above is down. Have you a link to octopus as
it stands now?

Is the C too large to post here?

I personally haven't a clue! If nothing else works perhaps you could
get a C compiler to translate it to assembler for you?

5395. Re: STOS Basic - Screen as a String

Newsgroup: comp.sys.atari.programmer
Date: 2002-07-15 14:52:43 UTC
From: Elliot <stuff@recycledsteel.co.uk>
Message-ID: <1026744765.12853.0.nnrp-08.3e31118f@news.demon.co.uk>
Source record: 714
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hmmm, it has been some time but this may help, it is just an extension on what was said.

Think about the fact that a screen is exactly 32000 bytes, I think the rest is just palette on a PI1 and palette plus colour rotation/change on a NEO. Assuming each screen has the same palette then it is not a problem as it can simply be loaded before you start displaying, if not you can mask them off and put them into another bank and change the colour palette with each new frame.

The point being, if this is done then you only need to change the screen address each VBL and not to have to copy the screen into the LOGIC area, it can simply be replaced with;

```
reserve as data 10,32000*5
load "pic1.pi1",start(10)
load "pic2.pi1",start(10)+32000
load "pic3.pi1",start(10)+32000*2
load "pic4.pi1",start(10)+32000*3
load "pic5.pi1",start(10)+32000*4

for PICNUM = 0 to 4
for FPS = 1 to 5
wait VBL
next FPS
physics = start(10)+(32000*PICNUM)
next PICNUM
```

This should produce a simple animation at 5 FPS, it will only last a second with 5 frames (increase the FPS loop to make it last longer). I can not find my STOS book but I think that you need to put a SCREEN SWAP command or something similar after the "next FPS" but you will have to look into that yourself.

The only advantage this has is that the COPY command is removed, this will free a massive amount of CPU time. The only problem with this is that you may have to a line the BANK to 16bytes (I think) as the STFM Shifter is not that great, if the screen looks very wrong then this is the problem - can anyone help with this?

32K images by 30 odd images will be a lot of RAM (well 960K), you will be lucky to get it into a 1mb machine. As the other chap mentioned, STOS supports compressed images, a 32K image will go down to 4-5K or so, this means that you should be able to go from 30 frames to 210, at 12 FPS you will get 17 seconds or so on a 1mb machine. I do not want to go into that

any more as I can not remember it, there is also a lot of optimising that
can be done in all of this too, I think you can compress just sections too
so you can change your screen to say 160x120.

I have lots of STOS code about with Demos in mind, none of it released but
you may be interested. I also spent much time optimising code in STOS and
there is lots that can be done. Mail me if you want to look over stuff
(stuff@recycledsteel.co.uk).

Free porn!!

If you will burn Bruce's fog before desks, it will eerily taste the kettle.
What did Sharon play the disk behind the lost poultice?

porn smut teen babes girls cunt twat pussy anal
As incredibly as Ibrahim helps, you can improve the diet much more
badly. Garrick's frame teases inside our pin after we believe
without it. A lot of young kind bandages happily solve as the
hollow sauces behave. No sick dog or doorway, and she'll locally
answer everybody. If you'll call Ahmed's autumn with grocers, it'll
truly play the weaver. How does Said fear so subtly, whenever
Aslan departs the filthy lentil very wrongly? If the rich disks can
dye grudgingly, the rural frog may care more corners.

They hate noisy hats, do you mould them? Some buckets lift,
pour, and nibble. Others surprisingly excuse. Yesterday, go
grasp a desk!

No boats will be elder old bowls. Tell Felix it's urban walking
throughout a floor. These days, it moves a paper too cold inside her
angry lake. Her painter was outer, light, and promises under the
morning. We clean the blunt tailor. The goldsmith near the
sweet kiosk is the shirt that explains undoubtably.

Who wastes fully, when Bert irritates the open puddle beneath the
sign?

Are you blank, I mean, killing for upper ointments? Will you
taste around the hill, if Darin annually recollects the pitcher? They are
ordering without the college now, won't learn figs later. Many
younger think game changes cans among Simon's fresh raindrop. It
joined, you climbed, yet Kareem never dully attempted beneath the
evening. Plenty of clean eggs are sour and other rude cups are
stupid, but will Elmo converse that? Get your tamely loving
unit behind my ocean. How doesn't Rasul cover cruelly? Let's
kick at the stale squares, but don't smell the raw cases. Other
polite weird doses will attack quickly under lemons. Why will you
dream the cosmetic clever films before Rasul does?

He might judge smart ulcers alongside the dull worthwhile light, whilst
Zakariya deeply looks them too. Better burn spoons now or Alhadin will
hourly fill them for you.

I was seeking to comb you some of my fat bushs. While shoes sadly irrigate plates, the cars often reject for the dirty aches. Feyd, without caps durable and sticky, creeps over it, laughing stupidly. It's very closed today, I'll shout finitely or Said will wander the jugs. Sometimes Sadam will arrive the gardner, and if Jeremy wistfully cooks it too, the ticket will receive about the wet house. The difficult onion rarely likes Sayed, it scolds Osama instead. If you will recommend Tommy's hallway around drapers, it will stupidly live the carpenter. For Susie the porter's handsome, above me it's full, whereas in front of you it's measuring short. Lots of humble printers open Said, and they eerily expect Dick too. When did Waleed sow alongside all the potters? We can't jump counters unless Haron will strangely talk afterwards. No shopkeepers halfheartedly lift the unique hall.

They globally mould between deep pathetic drawers. Catherine cleans, then Said gently pours a active orange near Doris's sunshine.

It should join weekly, unless Sadam helps butchers in back of Ibraheem's carrot. What did Anastasia order the wrinkle for the bizarre candle? Tomorrow, Alfred never converses until Angela burns the good button wanly. Otherwise the kettle in Sarah's ball might like some quiet exits. Where Hassan's bitter tag calls, Raoul learns alongside ugly, strange ladders. He'll be tasting near thin Allahdad until his poultice changes furiously. Lakhdar, still departing, believes almost freely, as the cat scolds under their teacher. Don't try to nibble the tapes inadvertently, recommend them crudely. He might generally waste lazy and attacks our lean, easy pears below a stable. She can reject the proud fork and excuse it around its satellite. Try arriving the structure's poor smog and Blanche will fill you! It can cover loudly if Owen's pumpkin isn't lower. Rasul! You'll kick books. Hey, I'll explain the pen.

Said wanders the elbow with hers and believably pulls. Fucking don't attempt eventually while you're looking throughout a sad jar. Don't try to creep a envelope! Both dying now, Norris and Claude judged the dark bedrooms for healthy twig. To be distant or bad will sow inner enigmas to weakly hate. The coconuts, tyrants, and powders are all hot and heavy. Yesterday, walnuts shout with wide planets, unless they're solid. You won't jump me improving over your empty monument.

I am slowly dry, so I love you. I was solving coffees to glad Yosri, who's caring against the barber's stadium.

They sneakily receive without Ahmad when the long stickers tease beside the cheap swamp.

(not rewriten by this good Newsie)
Thanks Guy.

Here is the C, I don't know to translate it in xbios function that I can use in Gfa or assembler.

CD-ROM Fcntl()s and structures

Copyright (c) Julian F. Reschke (jr@ms.maus.de), 16. Mai 1994
Free distribution and usage allowed as long as the file remains unchanged.

These Fcntl() opcodes provide a *nix-like interface to the CD-ROM specific functions. They can be used either with a MiNT specific CD-ROM device driver or with new MetaDOS BOS lowlevel drivers. For MiNT mounted device drivers, the interface is

Fcntl (short filehandle, short opcode, long arg)

(with filehandle a handle to the opened CDROM device driver) or

Dcntl (short opcode, char *name, long arg)

(with name being the name of a file or directory on the mounted CD file system).

For MetaDOS BOS drivers, the interface is

xbios (0x37, short device, long magic, short opcode, long arg)

where 'device' is a MetaDOS XBIOS device number ('A'..'Z') and 'magic' is 'FCTL'. With MetaDOS version >= 2.40 and the appropriate DOS drivers, you can also use the GEMDOS call Dcntl (thus being compatible to future MiNT drivers), because MetaDOS 2.40 implements some of the new GEMDOS calls and Atari's ISO9660F.DOS passes all Dcntl calls right down to the BOS driver.

Note that there is an 'old' CD-ROM audio interface for MetaDOS, but the commands depend on the custom CDAR 504 controller and can't be fully implemented for SCSI drives (in fact they are, with some restrictions). Consult the MetaDOS developers manual for further information.

In both cases, EINVFN (-32L) is returned for unknown opcodes.

Note that MetaDOS drivers return EUNKNOWN (-3) if XBIOS opcode 0x37 is not supported!

Drivers supporting this interface (send updates to jr@ms.maus.de):

MetaDOS BOS drivers (driver name, company):

HS-CDROM.BOS
Hard &Soft, Castrop-Rauxel, Germany
Generic driver for SCSI-CDROMs connected to ACSI or SCSI and
for the CDAR504

FX001???.BOS, CDU33???.BOS
Gellermann & Fellmuth GbR, Berlin, Germany
Drivers for Mitsumi drives connected to internal or parallel
interface.

MiNT device drivers (driver name, company):

CD-ROM Fcntl opcodes
```

```
Get block number of first sector in last session of a multisession CD. Argument points
to a LONG. Used by iso9660f.dos
#define CDROMREADOFFSET (('C'<<8)|0x00)

Pause audio operation
#define CDROMPAUSE (('C'<<8)|0x01)

Resume audio operation
#define CDROMRESUME (('C'<<8)|0x02)

Play audio. Argument points to cdrom_msf structure
#define CDROMPLAYMSF (('C'<<8)|0x03)

Play audio. Argument points to cdrom_ti structure
#define CDROMPLAYTRKIND (('C'<<8)|0x04)

Read header of table of contents. Argument points to cdrom_tochdr structure
#define CDROMREADTOCHDR (('C'<<8)|0x05)

Read a toc entry. Argument points to cdrom_tocentry structure
#define CDROMREADTOCENTRY (('C'<<8)|0x06)

Stops spindle motor
#define CDROMSTOP (('C'<<8)|0x07)

Starts spindle motor
#define CDROMSTART (('C'<<8)|0x08)

Eject medium
#define CDROMEJECT (('C'<<8)|0x09)

Sets audio playback volume. Argument points to cdrom_volctrl structure. Only for
compatibility
to Unix drivers, see also CDROMAUDIOCTRL
#define CDROMVOLCTRL (('C'<<8)|0x0a)

Read subchannel information. Argument points to cdrom_subchnl structure
#define CDROMSUBCHNL (('C'<<8)|0x0b)

Read Mode 2 or 1 sectors. Argument points to cdrom_read structure. Blocks have either 2336
or 2048 bytes.
#define CDROMREADMODE2 (('C'<<8)|0x0c)
#define CDROMREADMODE1 (('C'<<8)|0x0d)

Lock eject mechanism
#define CDROMPREVENTREMOVAL (('C'<<8)|0x0e)

Unlock eject mechanism
#define CDROMALLOWREMOVAL (('C'<<8)|0x0f)

Control audio settings. Argument points to cdrom_audioctrl structure
#define CDROMAUDIOCTRL (('C'<<8)|0x10)

Read Digital Audio (red book) sectors. Argument points to cdrom_read structure.
Blocks have 2352 bytes
#define CDROMREADDA (('C'<<8)|0x11)
```

```
Read media catalog number. Argument points to cdrom_mcn structure
#define CDROMGETMCN (('C'<<8)|0x13)

Read track international standard recording code. Argument points to cdrom_tisrc structure
#define CDROMGETTISRC (('C'<<8)|0x14)
```

I have no idea how Fcntl() and Dcntl() are implemented. Oh, hang on
Fcntl() is gemdos(0x104,...) according to the Compendium - and Dcntl()
is gemdos(0x130). If nothing's changed since then see below...

> (with name being the name of a file or directory on the mounted CD
> file system).
>
> For MetaDOS BOS drivers, the interface is
>
> xbios (0x37, short device, long magic, short opcode, long arg)

In Mark Williams C I recall that xbios(), bios() and gemdos() are
simple asm wrappers. The arguments are pushed right to left then the
corresponding trap call is made. Something like this...

```
move.l arg,-(sp) //4
move.w opcode,-(sp) //2
move.l magic,-(sp) //4
move.w device,-(sp) //2
move.w #$37,-(sp) //2
trap 14
adda 4+2+4+2+2,sp
```

Rooting around in MWC I find it does it generically thus (strange asm syntax in mwc)...

```
/
[snip copyright] ahem! ;-)
/
/ Xbios call function
/
.bssd
0: .blkl 1
.shri
.globl xbios_
xbios_: move.l (a7)+, 0b / Get return address
trap $14 / Do call
movea.l 0b, a0 / Restore registers
jmp (a0) / Return
```

```

> long lba;
>} cd_ad;
```

A union is "two things mapped onto the same space". This means that all of 'reserved,minute,second,frame' are crammed into 'lba' (and vice-versa) but unfortunately C has little to say on how this is accomplished. One would hope that 'lba' takes 4 bytes of storage and that 'BYTE' is defined to *be* a byte _and_ that the compiler will generate code that can pack bytes.

In reality, one would hope/expect that an atari compiler would generate code such that...

```
cd_ad.lba = 0x12345678;
```

...causes...

```
cd_ad.reserved to be 0x12;
cd_ad.minute to be 0x34;
cd_ad.second to be 0x56;
cd_ad.frame to be 0x78;
```

...and that if you then added code that caused...

```
cd_ad.minute=0xfe;
```

...then a subsequent read of...

```
cd_ad.lba yields 0x12fe5678;
```

I think the asm would go like this...

```
lba:
reserved: dc.b 1
minute: dc.b 1
```

```
second: dc.b 1
frame: dc.b 1

> Data structures used
>
>struct cdrom_msf
>{
> BYTE cdmsf_min0; start minute

> BYTE cdmsf_frame0; start frame
> BYTE cdmsf_min1; end minute
> BYTE cdmsf_sec1; end second
> BYTE cdmsf_frame1; end frame
>};

We ought to expect...

cdmsf_min0: dc.b 1
cdmsf_sec0: dc.b 1
cdmsf_frame0: dc.b 1
cdmsf_min1: dc.b 1
cdmsf_sec1: dc.b 1
cdmsf_frame1: dc.b 1

No doubt you can do the above two yourself now.

> BYTE cdte_datamode; currently not set
> cd_ad cdte_addr; track start
>};

The 'colon' denotes a bitfield. A nice idea in C but the implementation (worse than union) is so vague as to make portability impossible. It isn't even consistent across the atari compilers, let alone different platforms.

'unsigned' is the same as saying 'unsigned int'. The amount of bytes required to store 'int' depends on the compiler. With the atari we're looking at either 2 or 4 bytes. Discover which compiler this code was written for and someone will know for sure. Loosely (and iirc)...

MWC 2 bytes
PureC 2 bytes
Lattic 4 bytes
GCC 4 bytes

...but compiler options can change that: eg "-mshort" option on gcc yields 2 byte 'int' (I *think*).

In order for us to proceed I'm going to say 'unsigned' happens to be 2 bytes. No reason for that decision except I felt like it. Okay, back to bitfields...

If the above were this...

unsigned cdte_adr:4,
cdte_ctrl:4;

...then (don't memorise the next paragraph - I mention it only in case you come across it)...

The compiler may (because it's allowed to) use two separate 'unsigned' storage positions for the above (for performance against alignment). One would expect both the above to be merged into a single 'unsigned'. In fact as 'cdte_adr' is 4 bits and 'cdte_ctrl' is 4 bits then they'll even fit into a single byte. However *that* (pack into a byte of storage) should not occur: this is because the declaration is 'unsigned' therefore a whole 'unsigned' of storage will be allocated (even if both get packed into one byte and the other byte gets wasted). Er, forget this bit - it would require an essay!

Luckily things are a little less complex...

> unsigned cdte_adr:4; the SUBQ channel encodes 0: nothing,
> 1: position data, 2: MCN, 3: ISRC,
> else: reserved
> unsigned cdte_ctrl:4; bit 0: audio with pre-emphasis,

```
> bit 1: digital copy permitted,
> bit 2: data track,
> bit 3: four channel

...because both declarations are declared separately. This means
'cdte_adr' will take a whole 'unsigned' of storage and 'cdte_ctrl'
will take another 'unsigned' of storage. So we have...

...either...

cdte_adr: dc.w 1
cdte_ctrl: dc.w 1

...or...

cdte_adr: dc.l 1
cdte_ctrl: dc.l 1

...depending on the compiler that got used by the author. Also
dependant on the compiler: which 4 bits are getting used? Judging from
the comments, then bits 0..3 seems certain - but do bear (vaguely) in
mind that C compilers can store these bits anywhere in 'unsigned' that
they feel like.

Assuming the above...

```

You probably know, but '#define' is a constant - compiler simply replaces the textual name with the value then compiles it (EG: "add CDROM_LBA,d0" is effectively "add 0x01,d0").

```
> SUB Q control bits
>
>#define CDROM_AUDIO_EMPHASIS 0x01

>
>Get block number of first sector in last session of a multisession CD. Argument points
>to a LONG. Used by iso9660f.dos
>#define CDROMREADOFFSET (('C'<<8)|0x00)
```

A constant again, albeit a more complex one. Same procedure - replace the name CDROMREADOFFSET with the "value" '(('C'<<8)|0x00)' because that's exactly what the compiler does then it comes across it.

The '<<' is a bitshift and the single quoted 'C' denotes a character, which on the atari will be stored in a byte. Shifting a byte 8 times is not healthy but it does work in C because '8' is an 'int', and for the most part the compiler will promote datatypes up to the largest one used in an expression. Thus it turns 'C' into an 'int' (2 or 4 byte and irrelevent here) then shifts that 8 places yielding either 0x4300 or 0x000043000. I'll assume two bytes again 'cos it's less to

type!

The '|' is a bitwise OR (as opposed to a logical OR).

So we have
'C' (0x43) [move.b 'C',d0]
<<8 (0x4300) [ext.w d0] [asl.w #8,d0]
|0x00 (0x4300) [or.w #0x0000,d0]

Note that a C compiler can resolve these at compile time. No runtime
calculations required. Simply work out the values yourself then use
them directly...

>Pause audio operation
>#define CDROMPAUSE (('C'<<8)|0x01)

0x4301

>Resume audio operation
>#define CDROMRESUME (('C'<<8)|0x02)

5402. Powerpoint

Newsgroup: comp.sys.atari.programmer
Date: 2002-08-11 19:29:23 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <1029090563.10371.0@demeter.uk.clara.net>
Source record: 721

Some months ago I posted a question about Powerpoint file formats.
Anyway to cut a long story short my isp isn't forwarding posts so
no-one ever saw the question.

I later discovered that m$ doesn't release info about PPT files
so I set about dismembering a few files.

I have so far produced a script for the TUC (The Ultimate Converter)
that produces an RTF file containing all the text from the slides
plus some other random text. It's is then easy to edit the RTF in
Papyrus.

I have also written a PurePascal program that extracts PNG and JPG
images and WAV sounds from within the PPT file. It may work with
other files but I haven't tried it.

Both the script and the PurePascal program are Alphas but if anyone
is interested then drop me an e-mail (remove the spam preventer)
and I will send you the code.

As a side issue TUC runs ok on the Milan (NAES) but the text sent
to the screen is rubbish. Does anyone know why ?

Regards,

Peter

>what is the best c compiler for falcon? gcc 3.1? not?

With it you will be able to compile for any cpu included 68060, but I left it behind because of the unfriendly interface (my opinion).

You can jugde by yourself by using the best interface for gcc at : http://olivier.landemarre.free.fr then look for GCC interface.

>what is the best hand assembler for falcon?

Did you had a look at devpac 3 ?

Please let me know if this version of this compiller does know how to build 68030 and 68881 specific code. Or is it a generic ST compiller?

Thank you, fellas.

Wow, stop, another thing: what is the latest DEVPAC version for Falcon? And where can I download and/or buy (cheap) one?

Cheers!

AFAIK Lattice stopped in 1994 at v5.60 (basically a "Falcon upgrade"
to v5.5x)

Yes, v5.60 can compile 32-bit code for the '020 and '030, and can also
generate code for the '881 and '882 FPUs.

(I cannot recall if it can also do '040 code, as I've never needed to
do such code, as the best Atari I've owned is a TT with an 030 and
882)

In fact version 5.06 (the first version of Lattice I owned in 1992ish)
could do this as well. However 5.06 was not the "all in one"
environment that 5.60 (and 5.5?) are.

> Wow, stop, another thing: what is the latest DEVPAC version for
Falcon? And
> where can I download and/or buy (cheap) one?

Devpac/Atari stopped at version 3.10 in 1994.

It can handle code up to the 68040 (MMU, FPU included)

(BTW: I assume you know that Lattice includes an assembler - but is
suitable only for creating assembler code modules within an app. For
assembly-language-only apps, Devpac is better _and_faster_ and can
generate Lattice object modules if needed)

Thank you, good human! ;)

Another question for you:

I am looking to buy an FPU for my Falcon. Best electronics have both 68881 (50$) and 68882 (60$) in LPCC package. The difference in price in minimal, and 68882 is more advanced (i.e. can bee hardware hacked to operate at 50MHz). So I was considering 68882. But recently I came across info what with 68882 Falcon won't run certain ST apps, which it can run smooth with 68881...

So now I'm in doubt, which FPU should I go for...

I think I'll post this question in comp.sys.atari.st as well. May be good folks will give me some bright ideas for my choise ;)

Unfortunately I can't help but I have a question of my own...

How are you building SDL - environment, options etc?

I've recently noted that SDL looks interesting but sadly it considers
cygwin==mingw thus it may be very helpful to have another compilation
target to test my changes against (ie Frank's cygwin m68k).

This is from memory so I could be wrong but.....

Only the TT and Falcon had FPUs commonly, the MSTE and other had some hacked ones but they are rarely installed and so it would not matter (they used strange calls, etc), if your code is made compatible then it would only open up for a few extra people.

I managed to get a 50Mhz FPU (68882) from e-bay for only $14, this will run at 60Mhz no problems. The 16Mhz will only run at 25Mhz maybe and a 33Mhz at say 40Mhz (these are guesses).

The 68882 are much quicker, I think they do all instructions in one cycle.

Maybe you could do two binaries, one with and one without FPU.

CPU, FPU and DSP speeding hacks are easy to do and available all over the place. My falcon runs at 25/50/50 at present (a Phantom upgrade). I have a 60Mhz crystal which a plan to install, I have tried it with all chips (i.e. 30/60/60) but no joy, I am sure it will work with the DSP and FPU but I will have to bypass some of the Phantom bits (i.e. 25/60/60). I think the CPU will run faster but I believe the problem is the Atari chip that controls most of the BUS, I think it runs at 4x the CPU speed (i.e. 100Mhz) and it can not keep up with it.

Does this sound right to people or I am talking bollocks?

Also, if this is right, can the BUS chip be replaced by something else?

One more thing, what speed is the Videl running at with my above? Can that be boosted more it would it make no sense to?

Elliot...

...
>The 68882 are much quicker, I think they do all instructions in one cycle.

The '882 is not much quicker than the '881 at all. I have never heard of
a reason to take the '881 over the '882, though, so you might as well
get hold of the latter and earn a few cycles here and there.

No FPU that I've ever heard of, outside the DSP domain, does _anything_
in one cycle (while it would certainly be possible, it would have a
tremendous impact on the clock speed (which is one reason why many DSPs
clock much slower than contemporary general purpose CPUs)). The FPU in a
modern CPU can have a through-put of one cycle for many operations (and
might even do that for several types of FPU instructions at once), but
that is quite another matter.

In any case, the '882 is _very_ far from that kind of speed. Generally,
it is somewhere around 5-10 times slower than the '040 FPU, clock for
clock (for the operations that they have in common).
Something as simple as a register to register move, or an add, takes
more than 20 cycles on the '882 (2 and 3, respectively, on an '040),
multiply is 70ish (5 on an '040) and division (38 on '040) and
square root 100+ cycles (sqrt is 103 on the '040).

So, while the '882 is certainly a whole lot faster than doing FPU
operations on the '030, it is extremely slow for most normal things
even by '040 standards.

Hi, apologies if this is dead obvious.Only recently got a falcon and trying to figure out my way round the atari os again after 11 years away.

What it is, is that in future, I'll be getting zero-X, which is an audio program that can handle wav files. Very useful to ba able to transfer between my PC and falcon, on the same disk (and my sampler too for that matter).

Also, all the software I'm currently getting, off the net, it's a bit of a ball ache transferring it onto floppy disk to go and put it on the falcon.
Is there a way I can make both the Falcon and the PC read the same iomega zip disk so that I can bump everything onto it and transfer it over like that.

(For info purposes, I have HD Driver 8 which I'm using to format the zip disks on currently)

Thanks if anyone can offer up some pointers... RJ

Indeed, a FPU in a MSTE or ST operates differently than in a Falcon or TT-
instead of a "co-processor" CPU-FPU mode in Falcon/TT (mode not available
on MC68000 CPU) , in a (M)ST(e) the FPU is operated as a "memory-mapped
peripheral". The two operating modes are not compatible and require different
code. Truly, there are not many applications that can use a memory-mapped FPU:
e.g. programs compiled with Pure-C or Prospero Fortran (and possibly Gfa-basic
with Licom library) can use it, Dynacadd uses it, and a couple of games and
astronomy programs. There is an emulator (by Henk Robbers) of the co-processor
FPU which uses a memory-mapped one, but, unfortunately, applications which
provide for co-processor FPU most often also assume that a MC68020 or higher
is used, and so can not be run on a MC68000 even with the FPU emulator.

However, there is nothing "hacked" in the mode a memory-mapped FPU is used.
It is a perfectly legal way to connect a FPU to a MC68000 CPU and it was
described in the MC68881 manual. The FPU operates asynchronously to the
CPU< a any desired clock rate. In a MSTE, installing the FPU was a simple
plug-in operation (provided that the address decoding GAL was already in
place; otherwise the GAL had to be plugged-in as well). For a ST or MegaST
there was a SFP004 FPU Board (by Atari, iirc). The circuit for a memory-mapped
FPU is rather simple (basically, an address decoder) and is quite within the
do-it-yourself range. An installed FPU gives a speed benefit on floating-point
operations between 500% and 1500%, depending on the application.

Hi Rob!

Yes you should be able to do that. There should be no need to format the Iomega - just partition it with HDDRIVER and make sure that in 'Compatibility' the 'Windows' radio button is switched on and the 'TOS & Windows combined' checkbox is crossed. Note that this will only work with a single partition, but that shouldn't be a problem in your case.

As you may have seen earlier in c.s.a.st, I use a similar arrangement with SyQuest EZ135, using an Adaptec USB<->SCSI adapter. Originally I was going to move the drive from one machine to the other, but I managed to get a second drive cheap and now have one connected to either computer, so only need to move the carts. I see no reason why an Iomega should be different.

Regards, /Peter/

the earliest I've seen is the diskbased tos 1.0 (sometimes referred to as
0.98) there is no 64k tos roms, the earliest rom sets were 192k roms

the disk image is available on the net. From documentation I read
some time ago, the only functions it uses from the ROM are
rwabs() (read only) and getbpb().
Some TOS vars are perhaps needed too.
I don't see why the floppy image woudn't work on other 192k or even
256k TOS ROMs. (but I didnt test either).
Other (legal, open-source) ROMs do exist, that may be able to
boot the floppy. look for 'EmuTOS' on google.

Laurent.

While PureC is nice in its way (fast compilation and a good source
level debugger), I don't think you can buy it new these days.
Of course, someone might be willing to part with theirs.

gcc on the other hand is a much better compiler, and is free.
It does take a lot longer (and more memory) to compile things,
though, unless you run it as a cross-compiler on a PC or something.

Beware of trouble with 16 bit integers if you intend to port code
from other systems to PureC, by the way.

>Beware of trouble with 16 bit integers if you intend to port code
>from other systems to PureC, by the way.

Better yet, use "short" or "long" intead of "int" whenever possible.

From the very beginning, "int" was intended as the "I don't really
care how big it is" integer type. In the days of "all microcomputers
use int for 16 bits" (a quote from a C manual) we developed a bad habit
of using "int" instead of "short" (two fewer keystrokes).

Then for some unknown reason C compilers started translating "int"
as "long" (probably for the same reason Spinal Tap uses amplifiers
that go to 11 instead of 10). Since then I have become an advocate
for "int free" code.

I've even been tempted to replace all the ints in the system include
files, but then my code wouldn't be portable to anyone.

5425. whoami

Newsgroup: comp.sys.atari.programmer
Date: 2002-09-09 06:55:05 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <alhi3b$254c$1@news.comnet.co.nz>
Source record: 744

How do I get the user name/details from within my programs?

Essentially, I want to be able to do a "whoami" from within my app
without doing a Pexec("whoami") and capturing the (redirected to my
app) results - is there a DOS/MINT/MINTNET system call available?

I envisage something like this:

```
UserInfo userinfo;

...
if( GetUserInfo( sizeof( userinfo ), &userinfo ) ) {
if( strcmp( userinfo.name, "root" ) == 0 )
do_something();
else if( userinfo.group == supervisor )
do_something_else();
else if( userinfo.group == normaluser )
do_something_normal();
else
do_something_boring();
}
...
```

(Apologies if that mimics a W**tel system/call)

I'm using Lattice C 5.60 as my development environment running under
Mint 1.15.9 (and some version of MINTNET I cannot recall) and AES 4.1
on a TT with UK TOS 3.05. I also have MemoryProtection turned on.

The Compendium doesn't seem to give that info (or am I just not
reading it correctly?)

(Is there a MINT mailing list/group I should contact?)

Handy bookmark ;-)
http://www.rt.com/man

Looking at http://www.rt.com/man/getpwuid.3.html I believe this should
do the trick...

```
#include <iostream>
#include <pwd.h>
#include <unistd.h>

int
main()
{const struct passwd *const p(getpwuid(geteuid()));
cout<<(p?p->pw_name:"nowt")<<'\n';
return 0;
}
```

'whoami' appears to be nothing more than a wrapper for 'id -un' which
in turn looks as though it would be using geteuid() on getpwuid(). I
can't test it on MINT but it does work on Cygwin and when
cross-compiled using Frank's cross-compiler, the MagicPC demo yields
"nowt". In fact a MINT compilation would probably yield "nowt" on a
bog-standard ST because I can't see any reason why getpwuid() should
be doing anything more complex than parsing the password file. Perhaps
if "/etc/passwd" and "/etc/group" existed it may even return something
(?root?) on TOS?

>I envisage something like this:

> }
> ...
>
>
>(Apologies if that mimics a W**tel system/call)

Someone else ought to chip in here, but... I'm not entirely sure
checking for "root" is a good idea. I think you ought to do that
particular test on the numeric id, which is always zero whereas I
believe "root" can theoretically be changed (will still be zero
though).

#ifdef __CYGWIN__
define YE_OLDE_ROOT 18 //"root"=="SYSTEM"
#else
define YE_OLDE_ROOT 0 //"root"==??
#endif

if (YE_OLDE_ROOT == geteuid())
do_something()
else
if (userinfo.group == supervisor)
...

Yeah, Cygwin is an exception. I mention it just in case you ever
decide to test under that environment and fall foul if it. There may
be a proper "ROOT" macro but I dunno what it is - all the code I've
ever seen that checks for root is using zero (pita to find!).

From: Standa Opichal <opichals@seznam.cz>
Message-ID: <almo9f$8v4$1@mail.idoox.com>
Source record: 746

Hi All!

I'm trying to think about the $subj in terms of writing a MetaDOS
filesystem driver. Is the GEMDOS layer synchronized across the
processes? What I mean is whether I need to take care of
threadsafety of e.g. my Fread() replacement or not.
In SingleTOS this should be OK as long as only cooperative multitasking
is present. But what about MiNT or MagiC?

best regards

STan

Check out 16/32 Systems (Nick Harlow)
http://www.1632-sales.zenwebhosting.com/acatalog/16_32_Catalogue_Programming_15.html

He accepts credit cards and definitlely had it in stock this summer.

It's a complete C development package with almost everything you need.
There is no interpreter but a normal compiler, linker. An Assembler is
also included.

Comes on 7 floppies and manual in three volumes with a total of 1064
pages, indexes not included!

I'm working around one project and I need one copy of boot ROM loader
(TOS 0.98?).

I want separate TOS in:

XBIOS
KERNEL
GEMDOS
AES
VDI
DESKTOP

The ROMs are 16KB or 32KB in size (I think).

I don't need image of system disk or complete TOS in ROM. Just image of
early ROM boot.

THANK TO ALL

You want to seperate TOS? What do you mean with this? You want the
single parts? Just take EmuTOS. You will get the whole sourcecode too.
No need for seperation of old TOS. It all had still been
reimplemented.

>The ROMs are 16KB or 32KB in size (I think).
>
>I don't need image of system disk or complete TOS in ROM. Just image of

I can not provide just a loader. But you could simply grab our free
EmuTOS, which also provides boot loading, like normal TOS does. And it
is totally free. Also the source is available. If interested, look at:

http://emutos.sourceforge.net

Hello Johan,

JK> gcc on the other hand is a much better compiler, and
> is free.

I would like to try that. Does it require MiNT or will it
run on TOS alone? I looked at the GNU web site, but didn't
spot any reference to Atari on there.

JK> It does take a lot longer (and more memory) to compile
> things, though, unless you run it as a cross-compiler
> on a PC or something.

I have a NetBSD machines that might be able to cross-compile
for TOS. I'd need some way to tell gcc to build 68000 object
code. Would I also need Atari-specific header files and/or
libraries?

Hi there,

Anyone here tried programming the ST to read from the cartridge port? I'm working on a sound sampler and would like to compare what I've been trying to some other code to see if theres a better way to do it. I'm using C (laser C & GST C) and havent found many library routines to read / write byte or word (16bit) values to ram (aka peek & poke in basic).

JA> peek & poke in basic).

Well, with C you don't need peeks and pokes. Simply use pointers, let them
point to the desired address and read out the values:

char *bytePointer,
byteValue;
short *wordPointer,
wordValue;

bytePointer= <hex-coded address>;
wordPointer= <hex-coded address>;

byteValue= *bytePointer;
wordValue= *wordPointer;

These are absolute basics about C programming, you should read more about
pointer arithmetics if you want to read out larger parts of RAM.

Always make sure that you have the rights to read from/write to the
addresses you specify (see single/multitasking, memory protection,
supervisor mode, ...)

Regards,

Alexander

Hmmm. I designed a video digitiser that plugged into the cartridge port back when I was at University - that was 7 years ago though, and my memory fades.
From memory, the cart port is mapped into memory at a range of addresses, and I simply mapped the digitiser's framebuffer address lines to make it visible at that address....

Then you just do:
unsigned char *myFramebuffer=(unsigned char*)START_ADDRESS_OF_CART_MEMORY;
and access myFrameBuffer as an array.

For your application, you could decode a subset of the cart address lines to give you register access to your sampler.

Craig.

Yes. As for any operating system you also will need this for TOS.

Please have a look on the sparemint crosscompiler page:

http://wh58-508.st.uni-magdeburg.de/sparemint/cross-mint.html

Hi Craig,

What I'd been experimenting with is somewhat similar, I'd actually fiddled with using a small ML routine inside a C function (as apposed to pointers). One oddity I'd run across was also in the hardware side, when the unit was plugged in, the ST wouldnt boot up fully. I checked on the board I'd layed out and found that it wasnt placing the magic longword used for either the diagnostic cart or a program cart (I'd referred to the atari internals book). But I want to take a look for some other methods that might work a bit better for what I'm trying.

ttyl,
James

Hi Alexander,

Right now I'm working on getting working in regular TOS, and will be adding neodesk / geneva compatibility as I can for multitasking compatibility. The Method I'd tried first, what I'd called "peek / poke" equivalent was a C function with some ML (Assembler) code to read the desired memory locations (the addresses assigned to the cart port in this case) and place it in a data register in the cpu then pass it into a C variable. I'll give the pointer another look as it may indeed be a bit easier.

ttyl,
James

>some other code to see if theres a better way to do it. I'm using C (laser C
>& GST C) and havent found many library routines to read / write byte or word
>(16bit) values to ram (aka peek & poke in basic).

In the first instance, hardware access with C is trivial. Just force a
specific value into a pointer of the right kind then dereference it.

```
typedef unsigned short uint16; //whatever

uint16 * p =(uint16*)0x12345678UL; //declare

uint16 value=*p; //fetch word from $12345678
*p = value + 1; //store value into $12345678

*p++ //above more efficiently
```

Similarly, if you wanted to access (say) 6 bytes at a time: provided
you have an Ansi compiler (as opposed to K&R structure handling)...

```
typedef unsigned long uint32;
typedef struct {
uint32 hamster;
uint16 gerbils;
} FOO;

FOO * pp = (FOO*)0x12345678UL;

if (cage_door_open) {
FOO cat_food = *pp; //fetch six bytes from $12345678
}
```

In the second instance you need to be aware of processor architecture.
Motorola is big-endian so if $12345678 had the value $ABCD in it then
"*p" yields $AB in the high byte, $CD in the low byte...

```
*p >> 8 //$AB
*p & 0xff //$CD
```

...nothing more needs to be said on this because the code ain't being ported.

Third instance. Memory protection. Given valid C statement X, it's perfectly possible for X to fail because of memory protection. Code running in supervisor state can access anything. The default user state code cannot. Peek/Poke typically enters and exits supervisor state for you. Often these Peek/Poke routines can be seen to fail if you're already in superstate. See attached code for ideas.

Fourth instance. Hardware being talked to. Most Atari compilers aren't too clever on optimisations so when you write "*p++" you'll probably get one read access followed by one write access. It isn't guaranteed though. Theoretically...

```
*p++;
*p++;
```

...might not do a read/increment/write twice over. It might get optimised to read-once/add-two/write-once. Aside from specific compiler options, the "volatile" keyword exists to help but ultimately for precise control you'll require assembler: you'd probably want to use assembler if (say) your attached hardware resets on a double-read within a given time-period but not on a double-read over a greater time period. Of course, if your attached hardware was this difficult to talk to you'd be in superstate disabling interrupts and so forth.

My guess is, as you've been happily using peek/poke, then assembler isn't required and "*p" will work just fine.

Finally, just to confirm what you've no doubt guessed by now, ram access is no different. Obviously if you are transferring one word at a time then the ram will need to be allocated on an even address - iirc Malloc() (as opposed to malloc which isn't required to but I don't know of an Atari one that doesn't so will be ok to use) will always yield even-aligned chunks. Assuming...

```
*ram_address++ = *cart_ip_address
```

...can keep up, then it's your ram buffering stategy which will be key.

I faintly recollect that there were once products that worked in this way.
Maybe someone can supply the relevant addresses for any existing such
memory-mapped audio-in or audio-out devices, so that any new ones maybe
can be made compatible with some possibly existing software drivers/utilities?

Btw. a couple of days ago it came to my attention that I might build a
rather good audio player on the cartdidge port (i.e. the opposite of what
you do)- I found out that I could obtain for free a handful of quite good
12-bit D/A convertor chips... the only inconvenience is that they need a
clumsy +/-15V power supply.

I'm also use the m68k-mint-gcc cross compiler under NetBSD.

In order to compile something for the ATARI TOS you need:

- the cross compiler
- the cross binutils (linker, assembler and so on)
- the header files and libs for TOS/MiNT

You can compile the cross compiler itself (using the gcc sources and the
TOS/MiNT target patches) or I pack my setup into a tar file and you can
download it then.

Hi Djorje,

What got me started on this project was I needed something to record audio in stereo at 16bit resolution at 44.1khz sample rate (for audio cd recording). On the hardware side I've designed up a "cartridge" of sorts using a TI A/D IC with a matching PLL timing IC to provide the clock rate. The stereo/momo mode selection and sample rates (32 / 44.1 / 48 Khz) are selected via the cart port address lines. Since I'm more experienced in electronics than programming, the software is taking me a bit longer to get going.

5447. timer-interrupt routine - standards?

Hi!

I plan to build a small logging-utility that should protocol the uptime of the Atari (STBook) plus harddisc activity.

Thus I need to install a routine that does some checks each second (would be sufficient for my purposes). I want it to be a small tool without GUI "running" in background, so I don't like the idea of utilizing evnt_timer().

I know that with Xbtimer I can configure MFP-Timer A, but what if different programs want to use this as well?

Is there any standard/protocol on how to obtain this information? Is there any kind of 'locking' mechanism?

HTTP-links to helpful sites are welcome!

Regards,

Alexander

No details to hand (just about to go out) but the vertical blank
handler might be a possibility - you can even install a C routine if
it uses a standard stack-frame. There's a list of these VBL's
daisy-chained. Having done that you could use it to interrogate the
200Hz clock variable ('cos VBL frequency will obviously be dependant
on monitor) in order to get your one second trigger.

Hi, Derryck!

> Excuse me interfering, you mean "log" instead of "protocol" :-)

Well, you're right! That's a pitfall for germans, as there is a word
"protokollieren" that just means "write down everything you notice".

Thanks,

Alexander

That's a good idea. I just figured out that Timer A cannot be configured
for less than 50Hz, so there is not much CPU-time saved by utilizing it
instead of the VBL, if any at all.

I'll check this out. Thanks!

Hi folks,
I am trying to read the inputs from an analog joystick connected to the enhanced joystick ports on my Falcon. Does anyone know the addresses where this information and how large is the data is (do I need to Peek, Deek or Leek)?
Also are these addresses the same on the STE as they are on the Falcon?

Thanks,
Stephen Moss

Hi,

IIRC you should be able to transfer the URL to CAB via AV_STARTPROG.
Then the solution should not even be limited to CAB, but work on any
browser since the call is actually sent to the AV-SERVER.

Ideally, you might want to look in the environment for the string
"WWW_CLIENT=<path>" where the path to the browser should be stored.
Anyway, I am just writing this from memory, so I am not 100% sure it is
all correct.

Regards,

Joakim

5456. Lattice C link problem

Newsgroup: comp.sys.atari.programmer
Date: 2002-10-10 08:36:49 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <ao3dso$1ilb$1@news.comnet.co.nz>
Source record: 575

I am currently using Lattice C 5.60 to write an update to a database engine of mine that I am using within another app.

However, I have come across a problem that is hard to solve.

In one module, I have defined some data buffers as

```
Table __near dbtable[MAXTABLES];

char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

In the main dbengine header file, I have the following lines (with unneeded stuff removed):

```
typedef struct {
...
} Table;

#define MAXTABLES 4
#define TABLEBUFFE|RSIZE (128<<10)

// table definition buffer stored relative to A4 (in program
__MERGED section)
extern Table __near dbtable[MAXTABLES];

// database record buffer stored/accessed 32-bit absolute (at end
of BSS segment)
extern char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

so that the size of dbbuffer would equal 512k (4 x 128k) Ive never needed more than four tables open concurrently, and most of the record/info buffers I've wanted in the past have needed to be in the 120-125k range for each table, so I chose 128k to simplify addressing (shift by 17, or a "swap halves, clear low half, add to self" sequence that Lattice seems to prefer when generating 68030 code)

When I compile the program module which contains only data definitions, the source module compiles OK, with no errors. If I disassemble it (using the supplied Lattice OMD app), the dbtable and dbbuffer objects are defined, exported, and of the correct size.

I then added them to a library file, which happens without errors.

When I then link the library into the application, it links OK, and reports no errors, but the generated executable has one big fault - the dbbuffer has not got any memory space (the BSS segment of the app does not increase by 512k as expected) As it's the last symbol in the far BSS segment, when I clear the buffer, it zeroes stack space, and

causes the program to crash when it tries to return from whatever program function called the memset(dbbuffer,0,sizeof(dbbuffer)) function.

The map file shows that the udata (far BSS) segment has a size of 512k (80000 hex), buth the file with the dbbuffer symbol within it starts at offset 512k within the far BSS segment (ie no size allocated, else the far BSS would be 1 meg in size - 100000 hex)

If I comment out the definition in the library module, and define it in a program module, and then compile and link as needed, it does increase the BSS by 512k as expected. The map file showed the far BSS is now 1 meg in size.

Has anyone else had a similar problem? (Global symbol within library file not given any data/bss space in final app, but work as expected when linked in from a non-library file)

Is there a fix I can use to get around this? (Or is it something obvious that I just haven't tried?)

I forgot to mention that the dbbuffer symbol is referenced within the
dbCreateTable and dbOpenTable functions (it was not a case of a
non-refenced symbol not being linked in to the app, as could have been
inferred from the previous post) in code that looks like the
following:

```
for( index = 1, tableptr = &dbtable[0]; index <= MAXTABLES;
index++, tableptr++ ) {
if( tableptr -> inuse == 0 ) {
memset( tableptr, 0, sizeof( *tableptr ) );

tableptr -> inuse = 1;
...
```

```
tableptr -> buffer = &dbbuffer[index - 1][0];
memset( tableptr -> buffer, 0, sizeof( dbbuffer[0] ) );
...
// nonzero return means "success"
return index;
}
}

// zero return means "failure"
return 0;
```

Hello Atari users,

I made 2 simple programs using system functions to access the video hardware. One uses the VDI, the other uses the XBIOS: http://membres.lycos.fr/pmandin/download/video1.zip (98Kb).

I would like people to test them, specially if you have non standard video hardware (VDI, clones, external video board, Blowup, ScreenBlaster, etc...).

If you want to do a report, please give a maximum of infos about your machine: (ROM, VDI, hardware extensions, cookies present, etc...).

I need documentation for this:
- MVDI (Milan VDI with XBIOS extensions). I have a simple doc, but there is no info about how to detect if it is present or not.
- NOVA (Nova VDI with XBIOS extensions). I do not have any doc, if you have it, send it to me.
- Blowup, ScreenBlaster, others screen enhancers: Send me docs.

The goal is to add support for these extensions in SDL.

Source record: 581

Hello Paul,

I made 2 simple programs using system functions to access the video
hardware. One uses the VDI, the other uses the XBIOS:
http://membres.lycos.fr/pmandin/download/video1.zip (98Kb).

Ok j'irais voir, sorry : I'm gona lok at it.

If you want to do a report, please give a maximum of infos about your
machine: (ROM, VDI, hardware extensions, cookies present, etc...).

We made tests with Had's and Milan graphic cards : move16 is 40% faster than
4x Move.l.
Vq_trnfm is slow for ram<>ram transfers, a pure snail for ra<>graphic card ram
but 10 Mo/s for graphic card ram<>graphic card ram because it uses hard wired
routines.

I need documentation for this:
- MVDI (Milan VDI with XBIOS extensions). I have a simple doc, but there
is no info about how to detect if it is present or not.
- NOVA (Nova VDI with XBIOS extensions). I do not have any doc, if you
have it, send it to me.

After long searches I never found ani doc for the xbios(5) with graphic card and
Nova VDI.

If you would make DOOM using graphic card's ram as storage you could beat PC's
speed.

I'm ready to be your Had's bn'ta tester.

Regards (yves.rogneATEfree fr)

Source record: 582
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware; AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video2.zip (151Kb).

The AES version does the same work as the VDI one, except it displays in
a window.

I added MVDI support to the XBIOS version. If you have a Milan, test it,
it should give you info about available video modes. I will make a more
complete test program the next time.
Warning: it may crash your machine.

Thanks to people that tested the previous programs.

Nope!

>The concept makes it seem possible but in application I am not sure ;-)

...unless someone just happens to have written a tool to do exactly
that. ;-)

>Thanks in advance for any help.

The object library format will be different. Obviously you'll be able
to get the gcc format but whether PureC is documented is another
matter. Even if you could you'd be looking at using a "standard" C
call (C++ won't work 'cos of name mangling 'though you could front-end
your C++ guts with an "extern C", I digress) in the hope both
compilers used the same registers. This may in fact be possible with
the atari else I'd have stopped waffling by now. Soo... assuming it
does then there's a possibility of cheating by adopting a similar
approach to DLL's - just have one function which returns the address
of the others inside the static lib. If the gcc static lib is gonna
have undefined references (say, it tried to use PureC stdio calls)
then forget it again.

All things considered, much easier to chuck the source at PureC!

```

Could well be a Lattice bug but can't be sure. I'm a bit rusty but iirc C has a notion of a "tentative definition" (or is it "tentative declaration"?). ie what's this?...

```
#include <whatever>
int x; //outside func
int main(){}
```

...is it "extern int x" or is it "int x=0". Compiler assumes it's "extern int x" until something uses it, provided something else hasn't already done so in another compilation unit in which case it stays as "extern int" (and you get to use the "x" from the other compilation unit).

In other words compile the above and "x" won't appear. Add a second file...

```
extern int x;
void foo() {x=0;}
```

...and now "x" will appear (in main's code). What I'm not sure about is how clever C compilers are supposed to be. I've a suspicion they won't pick up on pointers to tentative declarations. You can test this simply by...

```
>
dbbuffer[0][0]=0; //or foo=dbbuffer[0][0]
>
> for( index = 1, tableptr = &dbtable[0]; index <= MAXTABLES;
>index++, tableptr++ ) {
> if( tableptr -> inuse == 0 ) {
> memset( tableptr, 0, sizeof( *tableptr ) );
>
> tableptr -> inuse = 1;
> ...
> tableptr -> buffer = &dbbuffer[index - 1][0];
> memset( tableptr -> buffer, 0, sizeof( dbbuffer[0] ) );
```

```
> ...
> // nonzero return means "success"
> return index;
> }
> }
```

...and, if I'm correct, try simply "dbbuffer[0][0]" - that alone may be enough to cause the compiler to reserve the space in the lib.

If it is a Lattice bug try wrapping the definition...

```
int foo=DONT_CARE;
char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
int bar=DONT_CARE;
```

...which might wake it up. ;-)

Dans l'article <5gqbpa.mja.ln@127.0.0.1>, "Patrice Mandin"
<pmandin@caramail-nospam.com> a tapotï¿½ avec ses petits doigts:

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware; AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video3.zip (155Kb).

There are some bugfixes for the three programs.

The AES version does the same work as the VDI one, except it displays in
a window.

I added MVDI support to the XBIOS version. If you have a Milan, test it,
it should give you info about available video modes. I will make a more
complete test program the next time.
Warning: it may crash your machine.

Thanks to people that tested the previous programs.

To me, an "extern" global var means "defined elsewhere" and "I might
want to reference it in this file"

If I don't use extern it means "defined here", so two files with "int
name" would generate a linker error "duplicate symbol definition".

Similar would happen if both were "extern int name = 3;" - both files
would be defining a global var and giving it a default value

If only one file had "extern int name" and the other had "int name =
3" or simply "int name", then everything would be OK - it would link
correctly, and work properly. (in the second case, it would be in the
BSS segment, and set to zero by TOS when the program was loaded, but I
believe that C doesn't give any "set to zero" assurance for
uninitialised global or static local vars)

```

I tried changing the file where it was defined, and made dbbuffer a static global var, relinked the library, and then relinked the app with the new library, and the linker complained of an undefined var (and hadn't linked in the file from within the library where dbbuffer resided). Restoring dbbuffer to a regular global var quietened the linker down (no "undefined symbol" errors), but generated the same "linked in, but no space given to it" error as before.

```
> If it is a Lattice bug try wrapping the definition...
>
> int foo=DONT_CARE;
> char __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];

>
> ...which might wake it up. ;-)
```

Thanks for the response.

I've always used something like

```
typedef struct {
...
} Type;

extern Type variable;
```

in my headers, and

```
#include <header>

Type variable;

// or else "Type variable = 12;"
```

in one of my source files, and it always worked, but this was the
first time it has failed.

I've never had problems with static-linked data buffers (up to a total
of about 1.5MB) in previous apps, so I assume I've either hit a
compiler/linker bug, or I'm just doing something wrong this time.

(I'd normally try to get the data buffers via "calloc(count,size)",
but that has often failed in the past when the computer memory gets
full, or I've got a few too many small calloc()'d items elsewhere in
the program)

The dbengine.h file contained lines like:

```
#include "0/types.h" // "uchar8", "sint16", "uint32" and so
forth

#define MAXTABLES 4
#define TABLEBUFFERSIZE (128<<10)

#define makehandle(...) { ... }

typedef ... Handle; // will fit into 32 bit unsigned int

typedef struct {
uint32 inuse; // its being used
Handle client; // client that is using this table
Handle handle; // this tables handle
schar8 *buffer; // data cache
} Table;

extern Table __near dbtable[MAXTABLES];
extern schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];

// I could possibly have included the buffer within the table
structure
```

and in a library module

```
#include "0/types.h"
#include "dbengine.h"

// actual definition of the dbtable global var
// referenced by CreateTable,OpenTable,ValidateTableHandle etc
Table __near dbtable[MAXTABLES];
```

and in a different library module

```
#include "0/types.h"
#include "dbengine.h"

// actual definition of the dbbuffer global var
// referenced by the CreateTable,OpenTable etc
schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

and in a source file using those symbols

```
#include "0/types.h"
#include "dbengine.h"

uint32 dbCreateTable( const uint32 clienthandle, const schar8
*filename )
{
uint32 index;
Table *tableptr;
uint32 handle;

// validate client handle, filename, create file etc

handle = 0;
for( index = 1, tableptr = &dbtable[0], index <= MAXTABLES;
index++, tableptr++ ) {
if( ! tableptr -> inuse ) {
memset( tableptr, 0, sizeof( *tableptr ) ); // wipe
out any lingering junk
tableptr -> inuse = 1; // we're using it now
tableptr -> buffer = &dbbuffer[index-1][0]; // give
the table an in-memory cache

makehandle(handle, ..., a );

// non-zero means success
return handle;
}
}

// zero means failure
return handle;
}
```

So, I'd assume the reference to the symbol name "dbbuffer" would've told the compiler it is used, and would link in the file that dbbuffer was defined in.

I've asked the linker to generate a map file telling me all the global symbols the application has, and which file they were in, and their addresses.

In one block (called "udata") for 32-bit undefined global data the file with dbbuffer in it appears, and shows that the symbol was at offset 512k within the segment, and had size 512k. The total size of the udata segment was 512k (ERROR!!)

If I added
#include "....dbbuffer.c"
to one of my source files, it would define the symbol, and wouldn't link the one from the library - and the "udata" size reported by the linker map file would be 1Meg - as I would expect.
Similar would happen if I linked the object file that defined the symbol.

The memory map for a lattice-compiled program is:

Program header
Code
"Far" defined data
"near" defined data
"near" bss
"far" bss
(debug symbols - and/or relocation table)

The stack (default 4k, but can be increased by using a defined external var at compile-time) is usually placed (by the runtime startup code) after the end of the far BSS block and can/will destroy any relocation/debug data placed in RAM when the program is run.

"near" data is referenced via A4 register, (in a data segment called "MERGED" in the linker map file, IIRC) which the linker places somewhere within the near defined/bss block, as Lattice cannot generate a 32-bit offset from A4, so "near" data/bss is limited to a 16-bit offset (+/- 32k). The compiler can generate 32-bit relative offsets when generating 32-bit code for an 030 CPU - but not for "near" data.

"far" data/bss is referenced as 32-bit absolute, and has no size limit, AFAIK.

(Although from reading one of the Hisoft books some years ago, the Lattice object file format uses the top 8 bits of a 32-bit address [I cannot recall what]. It rejects any symbol above 16MB in size when compiling. I'd assume one object file was limited to 16MB of data/code - or is that for everything?)

Agreed.

>If I don't use extern it means "defined here", so two files with "int
>name" would generate a linker error "duplicate symbol definition".

I know for a fact this isn't the case *now* but not for when Lattice
was written. There's an easy test...

$ cat c.c d.c

```
#include <stdio.h>

int x;
void foo(void);
int
main()
{
printf("main (x=%d)\n",x);
foo();
return 0;
}
```

```
#include <stdio.h>
int x;
```

```
void
foo(void)
{
printf("foo (x=%d)\n",x);
}

$ gcc -Wall -ansi -pedantic -Werror -o c.exe c.c d.c
```

...will link. If Lattice moans then it either predates whenever this
got clarified in the standard or has a bug. Your symbol table ought to
look something like this...

```
$nm c.o d.o
c.o:
00000000 b .bss
00000000 d .data
00000000 N .stab
00000000 N .stabstr
00000000 t .text
00000000 t ___gnu_compiled_c
U ___main
U _foo
00000010 T _main
U _printf
00000010 C _x
00000000 t gcc2_compiled.

d.o:
00000000 b .bss
00000000 d .data
00000000 N .stab
00000000 N .stabstr
00000000 t .text
00000000 t ___gnu_compiled_c
0000000c T _foo
U _printf
00000000 C _x
00000000 t gcc2_compiled.
```

...rather than me muck up the explanation of "C" and "D", here's the
relevent part of "info nm"...

```
`C'
The symbol is common. Common symbols are uninitialized
data.
When linking, multiple common symbols may appear with the
same name. If the symbol is defined anywhere, the common
symbols are treated as undefined references. For more
details on common symbols, see the discussion of
-warn-common
in *Note Linker options: (ld.info)Options.
```

`D'
The symbol is in the initialized data section.

You'd get "D" if you said "int x=VALUE" in one of the files, all the
others would remain "C".

Tecchie bit: 'x' has "static duration" (as opposed to static scope),
"file scope", and "external linkage". Due to the fact it is a static,
then provided none of the translations units give it a value, the
compiler *must*, and will implicitly say "int x=0" at the end of one
of the translation units.

>Similar would happen if both were "extern int name = 3;" - both files
>would be defining a global var and giving it a default value

That's illegal so it'll be a handy way of figuring out where Lattice
figures in the equation. Compilers tend to accept it though with mixed
results (usually bad) because it's more a linker issue than a compiler
one.

>If only one file had "extern int name" and the other had "int name =
>3" or simply "int name", then everything would be OK - it would link

All uninitialised static's will be zero. For the reasons stated above
(though it may not be readily apparent) ditto globals - because every
global actually manifests itself as a static somewhere iyswim! ;=)

> extern schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
```

Ah!

Add a macro to your project. Define only when compiling your lib...

```
#ifdef LIB_COMPILE
Table __near dbtable[MAXTABLES];
schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
#else
extern Table __near dbtable[MAXTABLES];
extern schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
#endif
```

...any scheme that does similar will do. EG:

```
#ifndef DBENGINE_H
#define DBENGINE_H DBENGINE_H

#ifndef LIB_EXTERN
# define LIB_EXTERN extern
#endif
```

```
//yer stuff
LIB_EXTERN Table __near dbtable[MAXTABLES];
LIB_EXTERN schar8 __far dbbuffer[MAXTABLES][TABLEBUFFERSIZE];
//yer stuff
#endif /* DBENGINE_H */
```

...then just "-DLIB_EXTERN" in the project that builds the lib.

```
> // I could possibly have included the buffer within the table
>structure
>
>and in a library module
>
> #include "0/types.h"

Atm we're having to look at it from two aspects teetering around "is
lattice standards compliant in this respect". Hopefully it is then I
can help more.

5470. [PROG] Need testers for video related programs (V4)

Newsgroup: comp.sys.atari.programmer
Date: 2002-11-05 20:14:09 UTC
From: Patrice Mandin <pmandin@caramail-NOSPAM.com>
Message-ID: <hq89qa.9jb.ln@127.0.0.1>
Source record: 589
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video4.zip (156Kb).

There are some bugfixes for the three programs. AES and VDI test programs
can be run in whatever bpp (even monochrome), and whatever resolution.

Feedback still needed for these programs. Thanks.

5471. m68k-atari-mint-g++ cross compiler pb

Newsgroup: comp.sys.atari.programmer
Date: 2002-11-06 14:33:16 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@free.fr>
Message-ID: <3DC9282C.7060402@free.fr>
Source record: 590

Hi group,

I'm trying to compile doxygen for Atari.

http://www.doxygen.org

I use cross-gcc for cygwin from the sparemint web site. Here is the make process: 4 library are built (libdoxygen.a, libdoxycfg.a, libqtools.a and libpng.a). Then, theses 4 libs and an object file "main.o" are linked to produce the executable.

the crash occurs in the final step (linking):
$ m68k-atari-mint-g++ -static -o ../bin/doxygen ../objects/main.o -L../lib -ldoxygen -ldoxycfg -lqtools -lpng -lc
collect2: ld terminated with signal 11 (segmentation fault)

Maybe the "atari" linker cannot deal with "big" libraries (libdoxygen.a size is near 6MBytes) ?

On the same machine, i compile doxygen natively without any problems.

Any idea ?

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video5.zip (157Kb).

There are some bugfixes for the three programs. AES and VDI test programs
can be run in whatever bpp (even monochrome), and whatever resolution.
Output can now be redirected to a file (see doc in archive).

CentScreen (CT2) and Milan MVDI support are available in the XBIOS
program. Please test if you have them.

Feedback still needed for these programs. Thanks.

Sources available on my web site, in the cleancode-0.5.tar.gz archive.

5473. GSlib 0.4.0 released

Newsgroup: comp.sys.atari.programmer
Date: 2002-11-09 15:50:28 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@free.fr>
Message-ID: <3DCD2EC4.30000@free.fr>
Source record: 592

```
Hello (atari) world :)

A new release of GSlib is available
http://perso.wanadoo.fr/arnaud.bercegeay/archives/gslib-0.4.0.zip

GSlib is a C library (built for sozobon, purec, gcc 2.81 and [cross]gcc
>= 2.95) to manage gemscript protocol. Sources, user doc, developer
doc, GS protocol (translated by Peter West) and examples are included in
the package.

GSlib is a windom extension (see http://windom.free.fr).
btw, windom 1.20 has just been release yesterday :)

What's new:
- new internal design (more that just one big C file)
- add new type GSHANDLE, GScmdfn and GSACK_ANSWER.
- change some prototype: functions now use GSHANDLE, GScmdfn and
GSACK_ANSWER in place of 'void' or 'int'.
- use Galloc() intead of Mxalloc() for global memory allocation.
- add utilities functions GSGetType(), GScount(), GSlength(),
GSszzcpy(), GSstrncat(), GSstrcat(), GSstrcpy(), GSstrncpy(),
GSGetNextString() and GSGetAppId(),
- GSGetNextCommandResult() is now defined as GSGetNextString().
- GSCmdInit() is now defined as GSstrcpy(), and so, the return value has
changed, and that function has some bugs fixed.
- GSCmdAddString() is now defined as GSstrcat(), and so, the return
value has changed, and that function has some bugs fixed.
- add support for hexa-encoding parameters (see functions GSHexEncode(),
GSHexDecode() and GSHexLength())
- change release naming, now use "Major.minor.revision", and the release
numbers are defined in the gslib.h header file.
- add documentation in source code, in doxygen format.
- the documentation is now generated using doxygen (a
dirty-modified-by-me version which could export document in UDO format),
and UDO.

Enjoy!
Arnaud

Hi Patrice,

I have a Falcon with CT2 but without CentScreen. I tried several
versions of CentScreen but never got it to work.
I ran your programs under TOS 4.04 in 256 color standard mode and the
color bars seem not okay.
The programs say that I have EdDi 1.20 installed. What is it ? Do all
Falcons have it or where did I get it ? Would be nice if all Falcons
had it, because then it would be very easy to check for pixelpacked
screen modes.

As I said above I don't know what it is and I never intentionally
installed it. So I can't tell you where I got it. If somebody told
me what it is (and what parts belong to it) maybe I would be able
to tell you where I got it or at least take it from my machine and
mail it to you.

I see that I cannot create radio buttons, check boxes and some of the other user interface elements so common today. Is there a way to do this with a standard resource construction program, or are there custom libraries that I can use to add these other user interface elements to my programs?

Actually you could with a great amount of work.

>Is there a way to do this with a
> standard resource construction program, or are there custom libraries that I
> can use to add these other user interface elements to my programs?

Yes, you can create dialogs and such with a resource contruction program with those elements. However, there is one catch. If you don't mind modal dialogs that block GEM activity while the user is interacting with your dialog, then GEM itself provides such calls. If you want non-blocking tasking freindly dialogs then you either have to code your own object handler or adopt one of the many object libraries out there. You choices on libraries might also be affected by the language you intend to code in.

I don't have a graphic card. Before I had the CT2 installed I have been
using BlowUp but that's ancient. And I use NVDI 5.03. So no idea really
where I got it.
And, BTW, still no idea what use to make of it. E.g. it would be nice
if my program when VDI says 8 planes only had to check whether EdDi
exists and says pixelpacked and otherwise would know that the screen
format is interleaved. But it doesn't seem to really be that easy.

Gerhard

5481. [PROG] cleancode-0.6

Hello everybody,

I am still working on my test programs for Atari systems.
The latest archive is there (88 Kb, only sources, no binary):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.6.tar.gz

It contains:
- Bugfixes
- Video: Added cookie detection for Overscan hardware.
- CD-ROM: Preliminary test program for Metados.

I need the Metados developper disk from Atari, so if anybody can send it
to me, I will be grateful. I don't need the bindings for Metados
functions, I have them.

Thanks.

Well I use GFA-Basic so I cannot suggest any 'C' lib's.
Perhaps someone into 'C' could jump in here and give you some pointers.

The RCS called 'Interface' is pretty good. If you surf around this site you can find it. I could not get the exact url as it uses frames and javascript. :-P I use this one myself.

http://www.hadley.de/frameset.htm

You can download Atari's RCS program here:

If you would be interested in joining in a small GEM programming competition this holiday season, send me an email at my netset account. If there is enough interest I'll finalize everything up next week via email.

Entries would be a small GEM Toy or Game with a seasonal theme.

No cash or Prizes, just programming for the glory and fun.

Please drop by http://gemcandy.atari-users.net and vote in the poll as well ;)

A guy at work was showing me the peer-to-peer file sharing
systems on the peecee and I wondered if there was any open-source
software that might be ported to Mint or had all ready been ported.

I found this:

http://sourceforge.net/project/showfiles.php?group_id=4467

which is GTK Gnutella. One of the source code files is listed
as platform independant. I think this might be related to Gaim
and the other GTK+ stuff that Piku mentions on Atari-source.com

I don't do much Atari development and I use Pascal so I am not
much use. Would this be portable to Mint or does it rely on too much
underlying software ?

Peter

Peter,

This kind of thing falls under the project that I am undertaking. Porting gdk/gtk to atari. Once this is done, any gtk application including gtk-gnutella will compile right over, though it's likely to consume excessive amounts of ram and run very slowly. It might be easier to port the underlying source and add an AES interface to it though I don't know much about this either. Still for now my work on porting gdk is going nowhere as my falcon simply doesn't have enough ram to compile stuff. Though in my head I just figured out an interim solution - Aranym.

woo hoo.

Thanks
Mark ;-)

Hello Atari users,

I made 3 simple programs using system functions to access the video
hardware: AES, VDI and XBIOS:
http://membres.lycos.fr/pmandin/download/video9.zip (161 Kb).

XBIOS:
- Added preliminary support for BlowUp (Falcon).

If you have one of these screen enhancers, please report and test:
- Milan with Milan MVDI driver.
- Falcon with CentScreen 3 (CT2), Videl Inside, BlowUp.

Sources are available (92 Kb):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.9.tar.gz

Well 6 people have stated in the Poll that they would participate.
But so far no one has sent me any email.

So we will make this a short one.

Rules for entries.

It runs in GEM in any resolution.
It has a holiday or seasonal theme.
It can be a game or toy.

Entries information should be emailed to me by the 24th of December
(Eastern Standard Time - United States of America).

I will put the information up on GEM Candy on December 25th.

Voting will start then and finish on January 6th.

Prizes:

There will be small graphics for websites for 1st, 2nd, 3rd, Participation
The thrill of competition.
The publicity for your self or your crew.
The encouragement to me to organize more of these things.

For more information email or go to
http://gemcandy.atari-users.net/

Please forward this/translate to other languages

I downloaded gtk-gnutella-0.91.1 last night and tried it on cygwin.
The 'configure' output is reproduced below. It may help a MiNT guru
decide if the port would be feasible. Personally I think that it is
and that if you've the relevent compilation tools upon your MiNT
system then you'd be able to compile it yourself. The GTK/GLIB version
is the only obvious caveat.

I did consider trying a cross-build but unfortunately haven't a clue
about rpm's - specifically there's a leading '/' in the GTK file list
and no way do I want that lot stomping into the root of my cygwin!
Suggestions on how to extract "safely" welcome.

Guy,

Note that there is already a gtk 1 port to win32 as well as most of hte other supporting libs. This is the kind of work that has yet to be done for the Atari. Gdk must adopt VDI calls in order to work on the atari which is not really much more than tedious work. I haven't enough ram on my system to even attempt to compile glib (which is needed by gtk) so I haven't bothered to try porting yet.

Mark

I located...
glib-1.2.8-1.m68kmint.rpm
glib-1.2.8-1.src.rpm
gtk+-1.2.8-2.m68kmint.rpm
gtk+-1.2.8-2.src.rpm
...on the sparemint site. These were what I was going to cross-compile
against until I hit the rpm worry mentioned above. FreshMeat reveals
'alien' which hopefully can turn them into viable tgz files but life
is never simple because now I'm wrestling with 'alien' build problems.

The Gnutella I compiled isn't a win32 one btw. Virtually all my cygwin
stuff targets "unix/X". Therefore all I really need is the 1.2.8
headers - I'll hack away the gnutella 'configure' version check and
see how much it moans. Linking isn't so important because I've no MiNT
system and associated X upon which to try it.

Okay, I got alien vaguely working and extracted the glib/gtk stuff.
Couldn't cross-configure it so instead let it configure natively then
hacked the two Makefiles accordingly - may not be an issue on a native
MiNT system (I've not looked in the configure script).

...[gtk-gnutella-0.91.1]...

That's about the limit of what I can do here, except *possibly*
produce a "gnutella lib" for someone else to link against.

Guy,

yes GTK can be directly compiled for Atari, but a true Atari port would use
the VDI. Currently you have to start GEM, then start an X server and THEN
run a GTK application. This whole ordeal will consume LOTS of ram. not to

mention the X server for Atari isn't too fast. already you can run this application, but seriously, AES + GTK + gtk-gnutella + X will probably consume 14 megs of ram on a falcon and be terribly slow. This stuff is better for clone owners or CT60 owners to be. I wanted to port gtk to vdi to avoid the need for an x server and to make gtk programs smaller, more efficient and directly useable from a gem desktop.

Mark

How much ram did you have to get that to happen, or are you cross compiling?

Mark

Oh dear, what have I started. Being the one that started this thread I must say I am impressed by your efforts. What is cygwin ?

I've never done any C programming on the Atari or under Unix. The nearest I came was developing a pile of C stuff for Oracle databases and dce to access some legacy apps from Oracle and vice versa. It was nearly all done on VMS. It was several thousand lines of code in about two dozen modules but I still don't call myself a C programmer. I cheat by thinking in Pascal and then translating to C but C's idea of pointers and parameter passing "does my head in".

I think I have enough memory on the Milan (144Mb :-) but I'm a bit low on HD space to install a C development system. If I ever get around to fitting a new HD I might look into it.

Are the Sparemint people interested in what your are doing with these libraries ? Surely it will open up some more possibilities.

Regards,

Peter

5502. ME.LDG release 1.00

Newsgroup: comp.sys.atari.programmer
Date: 2002-11-29 21:05:24 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@free.fr>
Message-ID: <3DE7D694.4090808@free.fr>
Source record: 522

Hi group :)

My dynamical library ME.LDG ("ME" means "Modular & Evolutive", formely known as "PARX system") has just been released. Since release 1.00, the ME.LDG archive contains sources and is under LGPL license.

http://perso.wanadoo.fr/arnaud.bercegeay/index_e.htm

ME.LDG is a lib to load, dither and display pictures, using M&E system (RIM plugins to Read IMage). Seems to work fine on falcon, magicmac, hades, aranym/fvdi...

RIRI2 (an image viewer) use ME.LDG, and is available on my web site.

Enjoy :)

Cygwin is an environment that lets you take source code designed to run on
LINUX and run it on Windows. One side effect is that you can also run the
ATARI version of the GCC compiler on Windows....

It seems that there's no translation.

Any volunteer to translate the file from german to english ?
pleeeeease... (the UDO file size is about 32kb)

Cross compiling with Frank's cygwin one, er...

Reading specs from /usr/lib/gcc-lib/m68k-atari-mint/2.95.3/specs
gcc version 2.95.3 20010315 (release)

...that one! ;-)

Ah, right. I knew it would be hefty but hadn't thought it would make
even a falcon struggle.

Any progress on that, or is it still at the head scratching phase?
I've compiled a lot of gtk stuff for cygwin, some hacking required as
well but never had to sit back and understand the big picture. Is the
low level stuff scattered all over or nicely grouped?

Me neither, I'm just the messenger! Nah, all it was, was a load of compiler compilation lines. The 'configure' phase decides what to compile and what the compiler options should be then generates one or more 'Makefile's. That was the 'make' output as it was compiled.

>Oh dear, what have I started. Being the one that started this
>thread I must say I am impressed by your efforts. What is
>cygwin ?

Unix on windows, http://www.cygwin.com if you're curious. The folks there have put loads of unix functionality into a DLL and compiled oodles of unix programs linked against this (cygwin1.dll). More folks keep coming along and adding more stuff. Almost the opposite of wine I guess.

>I've never done any C programming on the Atari or under Unix.
>The nearest I came was developing a pile of C stuff for Oracle
>databases and dce to access some legacy apps from Oracle and
>vice versa. It was nearly all done on VMS. It was several thousand
>lines of code in about two dozen modules but I still don't call
>myself a C programmer. I cheat by thinking in Pascal and then
>translating to C but C's idea of pointers and parameter passing "does
>my head in".

ROTFL and I'm sure you won't be the last! :-))

>I think I have enough memory on the Milan (144Mb :-) but I'm
>a bit low on HD space to install a C development system. If
>I ever get around to fitting a new HD I might look into it.

It does add up. C/C++ compilers do sprawl a bit - gcc especially stuffs a lot of information into generated files. Fortunately most of them can be deleted once the app is compiled to satisfaction and the executable itself can be stripped. You might even be able to compile yourself a pascal compiler!

>Are the Sparemint people interested in what your are doing
>with these libraries ? Surely it will open up some more
>possibilities.

Unfortunately I doubt it. Like Mark mentioned, limited machine
resources have to be catered for. SDL looks an interesting development
though.

From: anti.spam@nullepart.gouv
Message-ID: <3dea5a3c$0$22976$626a54ce@news.free.fr>
Source record: 528

Hello,

I'm looking for help from a 68040 programmer :

You probably know the programm XFERRATE.TTP this reliable tool gives the
bandwith for data transfer.

Some people tested the 68040/60 instruction move16 for ram data transfer
and we noticed it is 40% faster than 4xMove.l

I would like to know which speed we could reach if we used move16 in xferrate.

Unfortunatelly nobody wants to make the change. I would be happy to do
it but my knoweledges in assembler are basic. I can write some small
routines but am unable to understand a dissablembled programm.

Would it be someone that may help ?

Regards

Atari Hardware and Software
All of this was packed and put away 15 years ago. It is all clean and each device has its own
transformer and in most cases the original box and manual. The prices shown are expected
prices, other offers (no trades) will be entertained. Purchaser pays for shipping.

1) Atari 800 -- $180 (includes additional memory card)
Like new but needs video chip to control display.
Atari Memory Card (has a white 3 painted on it. Think it is a 16K board.)

2) Atari 400 -- $100
Like new

3) Atari 810 Disk Drive -- $70
Very clean and unaltered.

4) Atari 850 Interface Module -- $50
Plus 300 Baud (Believe it!) direct connect modem

5) Atari 1050 Dual Disk Drive -- $80
Very clean and unaltered.

6) Atari 410 Recorder -- $90 for Recorder & Tapes
Antic (Monthly) Tapes (Total 18 tapes)
Games and programs galore on each

7) Fastchip for 400/800 -- $70
Atari System Manual
Monkey Wrench Enhance Chips
Star Raiders Cartridge
Assembler Editor Cartridge
Basic Cartridge

8) Atari Program Exchange Software -- $40
Chameleon CRT Terminal Emulator
Program-Text Editor
Mathlib
Deep Blue C Compiler
MAC/65 (Assembler)
DOSKey

5513. Programmer needed

Source record: 532

Hi everyone,
last year I made a similar request for help and my thanks go to Pontus Skold who agreed to help and Roger Cain for his advice.

I now need help again, I have already used a disk editor to examine the software and was unable to locate the problem myself. The problem is with a STOS extension, after conversing with the author of the extension (with whom I have lost contact) I was informed that when I compile my programs the graphics extension checks for the TOS version before initialising where as the audio extension does not.
I believe that it is this TOS checking process that casues problems on my ST as both compiled programs using the audio extension only and non compiled programs function normally.

There is another difference between the graphics and audio extensions in that the graphics extension places data on even bounderies, this could also be the cause of the problem however I would have thought it would do that in both complied and non compiled states which is why I believe the TOS checker to be the cause of the problem.
All I need is for someone to find and remove this check, hopefully this is located in the compiler extension which is only 17K in size and so should not be too difficult or take long to do.

If anyone is interested in looking at this for me let me know.
I believe that the extension was written in assembler/machine code so you will need to have a program that can disassemble/reassesemble the file as I don't have one.
If it helps the error message displayed by the ST is "TOS error #82 press any key", when a key is pressed the message changes to "TOS error #32 press any key", further key presses redisplays the second error message

Thanks,
Stephen Moss

Nope. I was being naughty and configured it "native" (for a cygwin/X
build) then changed CC etc in the Makefile's such that stuff I didn't
have installed for cross-m68k would still "see" a header. ;-)

The OP asked if a gnutella port would be feasible. Basically the
answer would be (I believe) "yes" for MiNT/X and "no" for a non-MiNT
target.

GCC don't support these symbol formats. You can use the source level
debugger gdb instead (compile your program with option -g to generate
debug informations).

5523. GFA and NVDI printing?

Newsgroup: comp.sys.atari.programmer
Date: 2002-12-10 22:20:51 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3df668bce830f0@tripnet.se>
Source record: 542

I am working on a GFA program written in "old style" but clean GEM and adding report printouts using NVDI.

On my home computer with NVDI 5 I can print several pages using this code:

```
h&=V_OPNWK(pr_vdi_nr&)
IF h&=0
~FORM_ALERT(1,"[3][GDOS saknas!][Avbryt]")
ELSE
bildbredd%=INTOUT(0)
bildhojd%=INTOUT(1)
h_bak&=V~H
V~H=h&
CLIP 0,0,bildbredd%,bildhojd%
'
DO
x%=0
y%=0
INC sidnr&
klar!=@objlist_ritasida(bildbredd%,bildhojd%,ejxobj!,x%,y%,post&,sidnr&)
stat&=V_UPDWK()
LOOP UNTIL klar! OR stat&<>0
'
~V_CLRWK()
~V_CLSWK()
V~H=h_bak&
ENDIF
```

Sorry for the Swedish variable names etc but the procedure @objlist_ritasida does all the "painting" of a single page and the DO loop makes it print several pages.

With NVDI5 at home it works and all pages are correct but with NVDI4 on my job computer (yes, I really get paid for running this program!) page one is OK but when printing the next page the contents of page one is still present making a total mess.

On screen a simple CLS would fix this but how do I erase the content of previous pages using NVDI4 for printouts?

Also when using background printing with NVDI5 the "print queue application" is not ended after the printing is finished. And, if I start a second "printjob" I get new instances of the application. When the main program ends all ghost print queue apps disappears.

I guess I'm missing some calls to NVDI to make the background printing
working properly?

According to the gfa manual, v_clrwk() is equivlent to clearing the screen if used on a screen device, hense should do similar if used on a printer device and would clear the buffer.

I've not used these on a pinter, so I can only refer to the manual.

You need to add a v_clrwk() inside the page printing loop - according to The
Atari Compendium, v_updwk() doesn't clear the workstation. Add it after you
v_updwk() call...

Oops, I should have read the manual. I'm the proud owner of a genuine GFA 3 (with 3.5 and compiler info) printed manual in my native Swedish language. Quite a luxury these days when most computer litterature is in English so I have no excuses...

However NVDI5 does clear the area without the v_clr() call which made me (and my boss) a bit dissapointed when the NVDI4 setup at work did not work. I have told him that Atari applications actually works compared to Windows programs so it better be OK this time :-)

I just ask because the missing libintl.a that the linker complain in your
error report is in the gettext package. So just grab the libintl.a and
then you can successfully link I hope.

Hi,

I have loaded a GIF picture with transparency in memory, with
'vr_transfer_bits' function from NVDI5, it's work like a charm. (
"T_TRANSPARENT" mode)

If I display the same picture with vro_cpyfm, the transparent pixel are in
white. :-/

So, my question is: How can I display this pixel transparent with the old
vro-cpyfm function?

Thx
Zorro

Which mode (vro_cpyfm(handle, mode, ...)) did you use? Using
S_OR_D should do the trick.

Ciao

Thomas

Hello,

I made a simple program to test the PCI bios:
http://membres.lycos.fr/pmandin/download/pci2.zip (49 Kb).
(bugfixes since previous version)

Tested on Had s60 : no change ; unable to install ....

Regards

> > So, my question is: How can I display this pixel transparent
> > with the old vro-cpyfm function?

> Which mode (vro_cpyfm(handle, mode, ...)) did you use? Using
> S_OR_D should do the trick.

After some experiments, I have found the problem.

I have to do something like this:

- first create a MFDB with the "mask" of the picture.

- after draw the icon with a correct mode.

The code is like this:

```
vrt_cpyfm( handle, MD_TRANS, pxy, &mask_icon, &screen, colors);
mode = planes > 8 ? S_AND_D : S_OR_D;
vro_cpyfm( handle, mode, pxy, &icon, &screen);
```

It's not fast as the NVDI5 functions but it's work.

thx
Zorro

Hello Atari users,

Here are some new versions of my tests programs (153 Kb):
http://membres.lycos.fr/pmandin/download/cleancode-0.13.zip

The archive contains the latest version of:
- the PCIBIOS test program (I hope it *REALLY* works now).
- the audio XBIOS test program (with Falcon ext. clock detection).
- the video XBIOS test program (with NOVA support).

If you have a Falcon with an external clock, could you test and report
the audio test. Thanks.

Sources are available (121 Kb):
http://membres.lycos.fr/pmandin/download/src/cleancode-0.13.tar.gz

Hello Atari users,

Here are some new versions of my tests programs:
http://membres.lycos.fr/pmandin/en/perso.html#Cleancode

The archive contains the latest version of:
- the PCIBIOS test program (more info given, full names for devices)
- the audio XBIOS test program.
- the video XBIOS test program (Milan MVDI modified).

If you have a Falcon or clone with an external clock, the test may
crash the program (as it is still in the works). If you have a Milan
with MVDI, the current mode info should be nearly available. Please
test. Thanks.

Due to the way Lycos now handle downloads, I can not give direct URLs to
files anymore.

You may want to check your prices. B & C Computervisions has new Atari 130XE systems for than you want for a 32K Atari 800 that needs parts to be usable. I'm not trying to be an ass, but if you seriously want to sell the equipment, you should look at Atari retailers and on Ebay to see what the going prices are for what you are selling.

Hi all,

I've just added Peter West's translation of Dirk Haun's SE-protocol
description to the MISC section of my website, URL in sig.

There will be more to come in the following months, so keep your eyes peeled!

Cheers

Derryck

5543. Programming faster on clones

Newsgroup: comp.sys.atari.programmer
Date: 2003-01-06 20:28:31 UTC
From: fartfart@yahoo.com
Message-ID: <3e19e6ed$0$17166$626a54ce@news.free.fr>
Source record: 412

Hello everybody,

I am very happy that some programmers made there programms in more that one version, and one is 68020 compiled in order to run faster on clones with 68040/40.

I noticed that till now nobody did the same for graphic capabilities.
Well, I don't mean sp&#65533;cial graphic routines for ET6000 because it would request too much work for a too much small amount of owners (I got that reply),
I mean making programms simply using Vro_copyfm when a graphic card is detected and a very fast display is needed.

We, Milan an Had&#65533;s users, made some test using functions that increase speed on our computers :
- Move16 assembler instruction : only available since 68040 and must be half line aligned. Moves 16 bytes in one time and works only for ram-ram copy.
It is 40% faster than 4 xmove.l.

- vro_copyfm : slow as usual for ram<>ram or ram<>screen transfer, but faster than light for screen<>screen transfer (sprites have to be stored in the not displayed graphic ram).

Here are some results and an example.

Test of sprite display with an S3 trio graphic card and a 68040 :

Test Transfert Image RAM->screen :
Vro_copyfm : Transfert Image 100x: 872/200 secondes
Move16 : Transfert Image 100x: 196/200 secondes
MOVE.L : Transfert Image 100x: 234/200 secondes

Test Transfert Image screen->screen :
Vro_copyfm : Transfert Image 100x: 46/200 secondes
Move16 : Transfert Image 100x: 957/200 secondes
Move.L : Transfert Image 100x: 981/200 secondes

Dur&#65533;e Scrolling: 6301/200 secondes

/* ** */
/* * Transfert li&#65533;aire d'un bloc de 32000 octets * */
/* **

In article <3e19e6ed$0$17166$626a54ce@news.free.fr>,
M&#65533;gamodeste <fartfart@yahoo.com> wrote:
...
>I mean making programms simply using Vro_copyfm when a graphic card is
>detected and a very fast display is needed.

A very good idea.

>- Move16 assembler instruction : only available since 68040 and must be half
>line aligned. Moves 16 bytes in one time and works only for ram-ram copy.
>It is 40% faster than 4 xmove.l.

MOVE16 is faster because it bypasses the cache (unless the data it needs
to read is in there) and thus does not need to read an entire cache line
before writing to it (which a normal write with MOVE must do).
I'm not sure what MOVE16 would do when writing to uncacheable memory
(which would not require the cache line load), as should be the case
with graphics card memory. Possibly the CPU and chipset could work
together to do a burst transfer over the PCI bus.

Since MOVE16 requires the source and destination addresses to be
16 byte aligned, however, it is not something that can be used all the
time, unfortunately.

>- vro_copyfm : slow as usual for ram<>ram or ram<>screen transfer, but faster

There's nothing that's stopping vro_cpyfm from using MOVE16, or any
other optimized memory transfer method, obviously. The VDI will have
some overhead, though, which can be significant for small blits.

Also, note that there's no guarantee that you even _can_ access the
screen with direct CPU accesses. That's normally true when using the
native fVDI driver for ARAnyM, for example.
The normal Atari mode drivers for fVDI can be used in a mode where
direct screen access will not work together with VDI drawing, due to
the use of a separate 'shadow buffer' (in fast RAM on an AB040 or CT60).
While the screen is accessible directly with the standard configuration
of the fVDI RageII (Eclipse) driver, making use of that can have serious
performance considerations (the display memory is banked using the MMU),
and can even cause infinite bus error loops on an '040 (due to the fact
that there is only a single bank).

>than light for screen<>screen transfer (sprites have to be stored in the not
>displayed graphic ram).

fVDI/RageII should normally be configured to cache smallish blits from
RAM to the screen in graphics card memory, by the way, as well as

background save/restore blits from screen to RAM and back again.

># Test of sprite display with an S3 trio graphic card and a 68040 :

Note that a sprite is seldom an unmasked NxM block. If you do any
kind of masking, MOVE16 will be useless. MOVE16 also will not be
able to place your sprites at other than 16 byte aligned addresses.

Masked sprites could be significantly faster using the VDI, since you'd
presumably use mono-expand blit to write the mask and then you just
write the entire sprite to the blit engine and let it worry about
combining the data with what's already on the screen.

># Test Transfert Image RAM->screen :
>Vro_copyfm : Transfert Image 100x: 872/200 secondes
>Move16 : Transfert Image 100x: 196/200 secondes
>MOVE.L : Transfert Image 100x: 234/200 secondes

Assuming that the image was largish, that sounds like a bad
implementation of vro_cpyfm.

Anyway, I didn't see any pointer to your test programs, but I'd be
interested in trying them out under ARAnyM as well as fVDI/RageII
on an AB040.
In general, I'm interested in hearing from people who have good ideas
about things to add/change in the VDI to better support games and
similar software.

Hello,

>I'm not sure what MOVE16 would do when writing to uncacheable memory
>(which would not require the cache line load), as should be the case
>with graphics card memory.

As you can see in the tests, it work faster too.

>Possibly the CPU and chipset could work together to do a burst transfer
>over the PCI bus.

Unfortunately the writing throught the PCI bus is rather slow !

>Since MOVE16 requires the source and destination addresses to be
>16 byte aligned, however, it is not something that can be used all the
>time, unfortunately.

Right : it isn't flexible.
Half-line aligned = adress/16 ? I don't undderstand what is a 'line'.

Real drawback of the MOVE16 on 68060 : when the superscalar mode is enabledd
this function seems to be a bit slower. Only a bit, but it is.

>Also, note that there's no guarantee that you even _can_ access the
>screen with direct CPU accesses. That's normally true when using the
>native fVDI driver for ARAnyM, for example.

Ok

>While the screen is accessible directly with the standard configuration
>of the fVDI RageII (Eclipse) driver, making use of that can have serious
>performance considerations (the display memory is banked using the MMU),
>and can even cause infinite bus error loops on an '040 (due to the fact

Ok

>Masked sprites could be significantly faster using the VDI, since you'd
>presumably use mono-expand blit to write the mask and then you just
>write the entire sprite to the blit engine and let it worry about
>combining the data with what's already on the screen.

To much complex for me.

>># Test Transfert Image RAM->screen :
>>Vro_copyfm : Transfert Image 100x: 872/200 secondes
>>Move16 : Transfert Image 100x: 196/200 secondes
>>MOVE.L : Transfert Image 100x: 234/200 secondes

>Assuming that the image was largish, that sounds like a bad

Only designed for graphic card ?

>Anyway, I didn't see any pointer to your test programs, but I'd be
>interested in trying them out under ARAnyM as well as fVDI/RageII
>on an AB040.

Sorry, that programms are not mine. I asked the autor for sharing his programms but didn't got any repoly for now.

>In general, I'm interested in hearing from people who have good ideas
>about things to add/change in the VDI to better support games and
>similar software.

Same for me (-;

5549. Highwire

Newsgroup: comp.sys.atari.programmer
Date: 2003-02-18 06:55:54 UTC
From: fartfart@yahoo.com
Message-ID: <3e51d8f9$0$239$626a54ce@news.free.fr>
Source record: 418

Hello everybody,

Is there any release of highwire that runs under simple rom Tos ?

If no, why : wasn't it easyer to programm ?

Regards and thanks for that new browser.

5550. WTT: Anyone like to trade their pc engine for an atari portfolio?

Newsgroup: comp.sys.atari.programmer

Hello,

I have a complete in box, never used atari portfolio that I'm hoping to trade for a pc engine in good condition. I also have some portfolio accessories to sweeten the deal, if required. I live in Australia.

email me if interested.... jfairhall@DELETETHISBIT.hotmail.com

0.0.9a does IIRC. Newer ones should also (I have not tried them yet).

> If no, why : wasn't it easyer to programm ?

In two words (IMHO):
- (p)threads: easier to implement background downloading on a multitasking system
- MiNT-Net sockets: *reliable* implementation of a *standard* network API.

Background downloading is for computers with DMA, for my good Had>s I feel too much
the loss of power as the CPU had to do everythings (no DMA with a 68060).

Regards

5553. Psemaphore problem

Newsgroup: comp.sys.atari.programmer
Date: 2003-02-21 09:59:17 UTC
From: G Swaine <gswaine@the-gluepot.com>
Message-ID: <b34sus$2k6i$1@news.comnet.co.nz>
Source record: 422

I have recently started rewriting my old stock-controller program (I'm just about up to 14000 lines, and the original was almost 40000 lines of C) , and use a semaphore to detect if another copy of the program is running. However, sometimes I strike a problem ..

(I could probably have used a "find my app name in the /proc directory and search for duplicate names" instead of a mutually-exclusive semaphore)

The code fragment looks something like this

```
#define semaphore_id '....'

#define CREATE 0
#define RELEASE 1

int main( void )
{
ap_id = appl_init();
i( ap_id == -1 )
return errorNoApplInit;

if( multitasking() ) {
// non-zero return code = failed to create semaphore
if( Psemaphore( CREATE, semaphore_id, 0 ) ) {
form_alert( 1, "[3][Another copy of this app is
running][ Quit ]" );
appl_exit();
return errorCantGetSemaphore;
}
}

... // do stuff

if( multitasking() )
Psemaphore( RELEASE, semaphore_id, 0 );
appl_exit();
return E_OK; // I *think* that's a return code of 0
}
```

Unfortunately, sometimes the program would crash/bomb while "doing stuff", then the next invocation of the program [with a bugfix to prevent the crash/bomb] would find the semaphore still alive, and be unable to continue (it would have a different pid, and mint would return EACCDN during the create semaphore call)

The only way I can seem to fix the problem is to quit all running processes, and reboot the machine. (Is there something obvious I am overlooking?)

(The problem does not occur if the program exists correctly, and then I run it again)

According to the 1993-ish copy of the Compendium, the only process that can release a semaphore is the owner, and that one has crashed before it could do so, so the semaphore seems to still be owned by a [now deceased] process.

Is there a "list/kill semaphores" utility I can run from within Mint?

I presume it will be a text-mode program, and I'd most likely need to be logged on as "root"

I'm using Lattice C 5.60 as my compiler, and I'm running on a TT with memory protection enabled.

I'm using a 68030 version of Mint 1.15.9, Mintnet (I forget the version number it displayed at bootup), AES 4.1

That is not actually true.
For example on my Hades060 if I am on IRC or surfing the web, someone
can be uploading files to my ftp server on the same machine.

If you have a Hades and you are using just the built in single tasking
TOS, that is a serious waste of horse power. I often have 6 or more
applications running at any given time. If you install NVDI (gdos)
the Hades will render fonts and such even faster. ;-)

If the program crash/bomb you get problems.
The best way is to catch signals from MiNT when somethings goes wrong
and in the handler for a signal delete the semaphore before exiting the program.

I have that type of code in MyMAIL but I cant give a example now
as I am siting at the work at the moment and have no access to the source code.
If you like me to help do give me a mail to: erik.hall@tripnet.se

Hello,

I do the docs for Highwire. Just tried the latest version of Highwire under TOS and it worked fine. I was not connected to the Internet as I use MagicNet and MintNet with my cable modem, but it came up as always. Should work (I believe), if you are connected.

I am not a programmer, but the guys doing the job are slowly getting it into shape. It is taking some time, but things are getting done. It could go faster, but then Highwire would not as good as it could be. When it is done, it will be much better than anything the Atari computers have seen.

Yes, you need at least a GDOS (be it GDOS 1.0, FontGDOS, SpeedoGDOS,
NVDI, fVDI, TTF-GDOS or whatever) for displaying fonts but a
multitasking OS is not mandatory (yet?), at least for offline
browsing.

Not necessarily, I was thinking of images here: Highwire could (will?
can?) layout and display the main page while downloading images in the
background.

Hello everybody,

Thanks to all for your opinion.
I noted that this forum is flooded by Had?s user (-;

?Yes, you need at least a GDOS (be it GDOS 1.0, FontGDOS, SpeedoGDOS,
?NVDI, fVDI, TTF-GDOS or whatever) for displaying fonts but a
?multitasking OS is not mandatory (yet?), at least for offline
?browsing.

Ok : please tell me wich of the previous programm is free and easy to
install, and where to get it.
I'm happy with CAB who is a great programm, but if Highwire runs fine on
my computer I'm dying to try it.

?> Background downloading is for computers with DMA, for my good Had?s I feel
?> too much the loss of power as the CPU had to do everythings (no DMA with a
?> 68060).
?Not necessarily, I was thinking of images here: Highwire could (will?
?can?) layout and display the main page while downloading images in the
?background.

What's I meant is that we feel less the loss of speed with a DMA rather than
with a computer driven by one CPU who do all the job.

What's would make me happy is just to place the rom Tos in ram an run it there :
does anyone knows if it is possible ?
Only Gemram16 seems to work and the result isn't tremendous.

Regards

M?gamodeste

For more Hades info, see:
http://www.q1.net/~atari/
Follow the Clone link.
There is a mailing list for Hades/Milan users you can join if you wish
to meet more people. Not everyone with a Hades comes to usenet.

I cannot fully comment on all of these, as I only use NVDI.
NVDI is commercial, but well worth the money.

As far as I know this is the only program that does that which works
on the Hades.

If that is the same as fpu_3.prg in my auto folder, it is from Medusa.
You would need to talk to Fredi at Medusa Computer Systems.

I have never done any speed tests.

Hi!

I'm relly new to ST programming (in C). Now, after having so much hacked at EmuTOS I also would like to try out some "User Mode" programming. ;-)

If I would like to write a program just with VDI routines and without using AES services, I think, I could simply just do this under TOS. But what about the AES' screen, from which I do start? What can I do to restore this completely after I returned from my program? Do I have to be aware of special things, if such a program would run under MiNT?

I think of trying out some fullscreen stuff, similar to DirectX stuff, what might run on M$ boxes.

>

If you run the program when AES is running
you have to lock the screen with a AES call wind_update(BEG_UPDATE)
and form_dial(FMD_START, x1, y1, w1, h1, x2, y2, w2, h2) to reserve the screen area.

End the program with wind_update(END_UPDATE)
and form_dial(FMD_FINISH, x1, y1, w1, h1, x2, y2, w2, h2)

Best Regards
Erik Hall

>

Under MiNT:
If a AES is active, you must lock the screen (The AES runs independant of you)
The only correct way of locking the screen in such a case is wind_update, which
is a AES call.

Under single TOS it depends on the desktop. Possibly the desktop locks the screen
for you when you start a .TOS/TTP. In that case the desktop should also unlock and
redraw the screen when the .TOS/TTP program exits. It looks like the ATARI single TOS's
work like that. And emutos I hope ;-)

The problem however is that if you want to use the VDI, you must be a GEM program
with extension .PRG, .GTP or .APP

The solution is:
Dont be afraid of the AES, just use it, if only for the wind_update.

```
appl_init
form_dial(FMD_START) on the full screen.
wind_update(BEG_UPDATE)

Do your fullscreen thing

wind_update(END_UPDATE)
form_dial(FMD_FINISH) on the full screen. /* redraws the desktop */
appl_exit
```

Why it's Steve Sour.
Still reading every post? lol
I only seen this post cause someone reqouted it.
Apparently when I have my head up my arse I find you? Not suprising.
Your position on my killfile doesn't randomly change, you'd know that
if you would ever learn to use one. However, be please in knowning your
right next sinclap...

I'm mortaly wounded, i thought we had a professional reationship at least,
but sharing a killfile step with sinclap is the root of offensive!.

Not of all us are like that. I can agree alittle with you though.
There are alot more Hades owners then what shows up in these
UerGroups. Sometimes I do get a message from some of them and it
usually makes interesting conversation.

Hiya Steve,

Yes the grey hairs are starting to come, but I still feel like a
kid when I fire up my 130XE. Even my own kids like to play around
with it. My youngest has a 1040ST in his room and loves it.

Well... with RTL8139 and my driver for MiNTnet, you get DMA on
Hades/Milan. That 'no DMA with a 68060' is not really true.

Message-ID: <3e959040.0@entanet>
Source record: 450

Hi all,

Last year I wrote a small program to dismember Powerpoint files by extracting the JPG, PNG and WAV data. It was only a simple program but it did what I wanted at the time.

Today someone sent me a M$ DOC file which I was able to read with Papyrus but it doesn't extract the image data. So I tried my little program and was a little surprised to see both PNG files extracted.

I wonder if ROM would be intersted ?

One the subject of using Papyrus to convert DOC files, it always fails when I try. The error message says there is problem locating font TimesNewRoman.E24

I then open the ###TEMP.RTF file with a text editor and change the Times New Roman font entries to Life or another font and I am able to open this file.

I'm using Papyrus 8.23A English version

Regards,

Peter

Hi Jim,

I will send you the program but it only extracts the graphics and WAV
files.
```

However, I did write a script for TUC (The Ultimate Converter) that converts most of the text into an RTF file which will load into Papyrus and then needs quite a bit of work to remove the garbage that I am not able to identify.

I will mail both the program and the TUC script. If you can't find a copy of TUC let me know and I will send that as well.

Regards,

Peter

```
I have now done this and the program can be downloaded from:

http://www.peterslegg.scubadivers.co.uk/atari.htm

If anyone would like to add any features to the program then I can
also make the source code available.

Regards,

Peter

5587. [?] appl_tplay() and appl_trecord() on Hades

Newsgroup: comp.sys.atari.programmer
Date: 2003-04-15 11:48:32 UTC
From: François LE COAT <lecoat@lutece.net>
Message-ID: <3E9BF190.1040001@lutece.net>
Source record: 456
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

I have a Hades 060, and I work mainly with MiNT+N.AES.
I recently discovered that the AES calls appl_tplay()
and appl_trecord() are working under plain TOS. It
means that you can record events, and you can replay
them under TOS. It is useful to make demos of programs.

Unfortunately, I also discovered that these system
calls are not working on recent AESes (on the Hades at
least). It means that a recorded sequence cannot be
replayed under those AESes. These faulty AESes are
all derived from MultiTOS, and all faulty. Therefore,
MultiTOS, N.AES, Geneva have bad implementation of
those system calls. On those systems, the mouse begins
to move, as if all was right, and then it crashes the
Hades. The only solution is to turn the power off.

Not many people use those AES calls for ATARI programs.
I'm even wondering if I am the only developer for it.
Would you already experienced this problem ?

All replies will be welcomed ...

Best regards,

I recall discovering those two calls to be broken(*) under one of my
STFM TOS'es also.

(*)
Either didn't work at all or only unacceptable circumstances. Sorry too
long ago. I do recall deciding to forget about trying to use them.

Well, these system calls usually work fine. For instance, it
works very well on all various versions of MagiC (Mac, PC, ATARI).
It even works nice under ARAnyM, with TOS and MagiC. But, for
instance, it doesn't work under ARAnyM with N.AES installed
(I haven't recently tried Geneva or XaAES).

That's very strange ... That's why I say that the recent AESes
derived from MultiTOS (MultiTOS, Geneva, N.AES) are faulty.
I've put it on evidence with my Hades 060, and with ARAnyM.
As nobody use this system calls, except me, I'm very embarrassed.

Maybe I could try XaAES, but it has other problems of compatibility ...
I also tried with STonX, TOSbox, STEmulator or TOS2WIN, but this is
rather a problem of compatibility with these emulators. The only
emulator that works is ARAnyM (except from MagiC).

Thanks for your help !

Best regards,

Yes, and trusting my experience, it's badly implemented since
MultiTOS.

> (I'm just curious [I've never used those two AES calls] and I use a TT
> [TOS 3.05] for my GEM programming)

It works nice under plain TOS (on my Hades 060 it is TOS 3.06M).

That's right. But you don't really need a large buffer. I put
16ko by default in my RECORD.ACC, but it can be enlarged by the
user.

> (Apologies for my deviation from the original question)

You don't need to be sorry. These AES system calls are very
badly documented. For instance the integer value "speed" in
appl_tplay(buffer, count, speed); is not documented at all.
4 seems to be a correct value, that plays event at 1/1 speed.
But it may be different depending on the AES ... That's
really tricky ! Trust me ...

They seem to be adequately documented in "COMPUTE's Technical Reference
Guide ATARI ST VOLUME 2 AES" as well as in the Lattice C manuals.
The former does state that the functions currently (printing date is
1987) don't work, though.

>appl_tplay(buffer, count, speed); is not documented at all.

It's documented in both of the above.

>4 seems to be a correct value, that plays event at 1/1 speed.

The number is (according to the references above) supposed to be
a percentage of normal speed. That is, 100 should be normal speed,
50 half speed, 200 double speed, etc.

I've some documentation :
An old Lattice C document,
DDFS,
Compendium,
PURE C doc.
But I didn't found anything precise about these system calls.

>>appl_tplay(buffer, count, speed); is not documented at all.

That's completely wrong. These docs have been written by guys
that didn't know anything and that never tested what they wrote.
I say 1/1 speed should be around 4 or 5.
It works like this with MagiC (ATARI, PC, MAC), TOS, ARAnyM ...
As far as I tested. It's a shame to write things like that !

...
>But I didn't found anything precise about these system calls.

What's missing?

The following is a condensed form of what the Lattice C manual says:

```
typedef struct {
long ap_event;
long ap_value;
} EVNTREC;

// Play back user's actions
int appl_tplay(const EVNTREC *mem, int num, int scale)

// Record user's actions
int appl_trecord(EVNTREC *mem, int num)

ap_event ap_value
0 - timer event elapsed time in system ticks (1/200 s)
1 - button event low word button state (1 down), high word clicks
2 - mouse event low word x coordinate, high word y coordinate
3 - keyboard event low word key code, high word shift key state

scale is a speed percentage from 1 to 10000.

appl_tplay always returns 1.
appl_trecord returns number of recorded events. Normally equal to
the number requested.

Note also that the functions are supposed to (according to these
references) record user actions as above. They are not supposed to
record any other kinds of AES messages.
I assume the 'timer event' in there is not an actual timer event,
but rather a time marker to enable the playback at normal speed
(the occurence of a timer event is obviously not a user action).

>> The number is (according to the references above) supposed to be
>> a percentage of normal speed. That is, 100 should be normal speed,
```

>> 50 half speed, 200 double speed, etc.
>
>That's completely wrong. These docs have been written by guys
>that didn't know anything and that never tested what they wrote.

Well, since they are pretty definite, I'd guess they were going by
some documents from Atari. It's not Compute's fault if Atari decided
to do something different once they got around to implementing the
functionality. ;-)

>I say 1/1 speed should be around 4 or 5.

Strange that they would want to do such a change.
The 200 clicks per second from the 'timer event' should have been
easy to handle.

>It works like this with MagiC (ATARI, PC, MAC), TOS, ARAnyM ...
>As far as I tested. It's a shame to write things like that !

See above.

Anyway, this functionality was badly thought out in the first place,
IMO. I'm not surprised that the multitasking AESes have avoided
implementing this function.
Since what's recorded is not (according to the above) actual effects
of user actions, but the actions themselves, replaying them will only
work as expected if the screen contents are exactly the same as when
they were recorded. And if the user does not touch the mouse or the
keyboard at the same time. Kind of useless.

The Compute book claims the ap_event field is a short, which seems
to make more sense.
It agrees with the Lattice C manuals regarding the rest, though.

Just a short note here.
There is actually no legal way to tell the VDI to move the mouse
pointer. I'm not sure what the normal AES does, but Atari, as well
as the MagiC folks, obviously had special knowledge of the inner
workings of their various OS components.
Geneva, N.AES, XaAES etc do not have that luxury.

And of course, whatever special means the Atari and MagiC AESes made
use of is likely to fail when the VDI is replaced...

So, please have a look at my software Eureka :

http://eureka.atari.org/eurka304.zip

and test the RECORD.ACC accessory within it. You will see what
can be done with this very useful call. You can try under TOS
on every ATARI (I tested on 1040STf, MEGA STE 4, Falcon, TT,
Hades 060) under MagiC (every kind) or ARAnyM (TOS or MagiC).
It's much better than to dream reading a documentation, even
if it's made by ATARI Corps (bless them ...).

Good try ! And, keep it fun !

There will (most likely) be with fVDI once I get around to writing the
mouse handling code (probably not long now). Currently, fVDI relies on
the original VDI (or whatever other VDI was loaded before fVDI) to
handle the mouse and keyboard, and only makes use of the vex_ vectors
provided by that one.

And then there's the upcoming work to make the ARAnyM driver capable
of using a real (as in controlled by X, Windows, or whatever the host
graphics system is) mouse pointer, which will make even stuff like mouse
accelerators fail (since the VDI will no longer be in control of the
real mouse position at all).

Since NVDI appears to use the lineA variables in the same way as the
original VDI, it may not have a problem. Indeed, I would have
expected them to make sure stuff like this worked. Still, that doesn't
change the fact that the AES must resort to undocumented methods.

Of course, I could easily add a function for moving the mouse pointer
to fVDI, which could then be used by XaAES. ;-)

Looks like a nice program, though not something I have a use for.

>and test the RECORD.ACC accessory within it. You will see what
>can be done with this very useful call. You can try under TOS

If the circumstances are right, and the user cooperates, it can of
course be used (assuming the OS supports it).

I have actually even used it myself, in MGIF. The usage there was
precisely because I needed to move the mouse (not the displayed
pointer, since this was for full screen image display) to be able to
scroll a displayed image indefinitely using the mouse, and the VDI
didn't support that.
I guess I will have to update MGIF once I do the changes to fVDI that
I mentioned elsewhere. ;-)
Incidentally, the MGIF code has a special option to turn this feature
off since it is not compatible with all machines. Back then, there was
apparently a problem with Warp9 according to the MGIF documentation.

>It's much better than to dream reading a documentation, even
>if it's made by ATARI Corps (bless them ...).

Using undocumented behaviour is seldom a good idea.
If it's not documented, you should expect it to change at any time.
If it appears to be documented wrongly, it may be that it's the
implementation that is wrong, and that may be fixed at some point. ;-)

Yes, it's appealing as explanation. But it doesn't have anything
to do with the reality of what it does. It even doesn't give any
order of the range of values you can use ...

>>It's not implemented in XaAES, but it implemented in N.AES and
>>Geneva, at least. But it's wrong.
>
> In what way is it wrong? Or do you just mean that it does not work?

Well, it's partly working as I said before ...
If you have recorded a sequence on a correct configuration. This
is the case of the "EUREKA.REC" sequence that is included in the
archive of my software (Eurï¿½ka). Then when you try to replay it.

On XaAES, it completely skip it. When you start replay, it stops
immediately.

On N.AES, the mouse begins to move, but it stops 1 second later
with the ATARI freezed by a big bug ... You just have to turn the
power down.

On Geneva, it move very slooooooooooow ! The ATARI can't be rebooted
with <C-A-D>, because the computer is totally under control of a
slooooooooow turtle. I tried to change the "scale" factor of
appl_tplay(), but it has no effect ...

So, it seems that it could work, but it doesn't. That's why I
say that it is implemented, but badly implemented. That's all.

> I have actually even used it myself, in MGIF. The usage there was
> precisely because I needed to move the mouse (not the displayed

Ho, yes, I hadn't noticed that. For my soft, I don't generate
events, as you seems to do. I only record events in a big buffer
(16kb is quite enough), and then saving it as is in a *.REC file.
Then, I read the buffer with appl_tplay() every time I want.
It's a sort of mechanical piano that replays always the exact
same partition. I use it as a tool for making demos of Eureka.

> I guess I will have to update MGIF once I do the changes to fVDI that
> I mentioned elsewhere. ;-)

So, you will ? That's great !

>>It's much better than to dream reading a documentation, even

You're right. But keep in mind that it works the same way on
a great quantity of ATARI machines. You must respect that. And
ATARI TOS/AES/VDI are the references. As it works, not as it should
in a bad "documentation".

I told you about the DDFS documentation. It's french. It has been
made officially by ATARI France for the Falcon 030 developers. It's
the last official reference. There's nothing clear about these
system calls. Besides of that, it works also on a Falcon, as it works
on other platforms.

There's nothing to invent in this domain ...

Right. Bye for now ...

CONFERENCE ON SOFTWARE PATENTS

<http://www.europe-shareware.org/pages/communiques/
030428_conf_parlement.us.pdf>

Europe Shareware invites shareware authors and companies to take part next
May 7th & 8th in the parliamentary debates on software patents.

Mï¿œreau, 28/04/2003. During the current parliamentary work on the
COM(2002)92 directive concerning software patents, two conferences will
take place in May in Brussels.

On May 7th, a conference organized by Eurolinux, in which Europe
Shareware is an active member, will be held at the Dorint Hotel in
Brussels with many workshops including Members of the European Parliament
(MEP), experts and CEOs. Special guests include Professor Lawrence Lessig
from Stanford University, Professor Brian Kahin from Michigan University,
Richard Stallman and the Eurolinux experts in computer science, economy
and law.

On May 8th, the MEPs will organize a hearing for software SMEs in the
European Parliament. On the suggestion of Europe Shareware, Hï¿œkon Wium
Lie from Opera ASA and Thorsten Lemke from Lemke Software GmbH have been
invited to represent the shareware sector ; thus making shareware
companies one third of the panel.

We encourage shareware market players to contact us to register for these
events, so that the legislators take into account the impact of software
patentability on shareware in the final directive text.

Programme of the May 7th & 8th debates :
<http://swpat.ffii.org/events/2003/europarl/05/>

The directive text :
<http://www.europa.eu.int/comm/internal_market/en/indprop/com02-92en.pdf>

I got it to do all I wanted : backgound art files and text: presentation
pictures did not extract about 6 of them.. Otherwise very useful.

Hi Roy,

By "pictures" I assume you mean the embedded, vector art type drawings.
The PPT files I was working on had about 100 slides but only about 2
such drawings.

I think these pictures have the same format as those in Word documents
but I don't know any more than that.

Regards,

Peter

5606. Opcode VsetMask

Newsgroup: comp.sys.atari.programmer
Date: 2003-05-07 12:40:00 UTC
From: Gerhard_Stoll@b.maus.de
Message-ID: <200305071440.a21644@b.maus.de>
Source record: 475

Hello.

What is the corret Opcode from the XBIOS function VsetMask.

I have found two numbers:
0x5C (92) in the os_calls.pdf from Miachel Schwingen and Compendium, in all
other docs is 0x96 (150).

Gerhard

Source record: 476

Another layer of confusion to be added--which version of the Compendium do
you have? I think I have the second printing.

The errata for the first printing has a correction to a page 4.106. The
latest version does not have a page 4.106.

On page 4.100, Vsetmask is 0x96 (150)

The definitive answer might be found in a .h file in your gcc library.
This is where VsetMask is given a numeric value. Try grep. Or, for that
matter, grep/find/which .h files in any compiler that has that function
call available.

Jim

Pure C or Lattice C - commercial
Sozobon - free
GCC - free (but requires lots of memory)

TOS calls information is avialible on the internet, try searching on Google.

I was trying to compile some code that uses MT_AES lib, the .H file from this lib has lines like these ones:

```
#define appl_init() \

MT_appl_init( 0L )

#define appl_read( a, b, c ) \

MT_appl_read( a, b, c, 0L )
```

when i try to compile i got errors in this kind of lines with the "\" char to join to different lines in one. In the Pure C help is said that is possible to do it.

Any idea what could be wrong?

Thanks

>
> Any idea what could be wrong?

You seem to have an extra empty line between \ and MT_appl_*. Try this
instead:

```
#define appl_init() \
MT_appl_init( 0L )

#define appl_read( a, b, c ) \
MT_appl_read( a, b, c, 0L )
```

If you absolutely want the extra line, you have to add a "\" on that
as well, like this:

```
#define appl_init() \
\
MT_appl_init( 0L )

#define appl_read( a, b, c ) \
\
MT_appl_read( a, b, c, 0L )
```

Greetings,

Tomas

I recently had problems with this. Be sure the end of line is in Atari
format versus unix format. You can alter this using the free QED editor,
(File -> Info)

Thanks
Mark

I took a look....it is in Atari format....the problem came because
there is an extra white line between every two lines throug all the
mt_aes.h (i have no idea why).
Well i dont know if is clear what i mean....my english is limited. :-)

I read in Atari-Source that you have used Pure C for coding your AOL
client. Did
you use it whith multitasking OS? If yes....what shell or app did you
use to
edit the sources?....the Pure C original one is not very multitasking
friendly.

Hi group,

Please visit
http://arnaud.bercegeay.free.fr/gemlib/

Download my small test software (sources are included)
http://arnaud.bercegeay.free.fr/gemlib/vqdevinf.zip

and run it. This will perform the VDI 248 call (vq[t]devinfo) on your
system, and write back a report file (VQDEVINF.TXT).

Please send me back your report file (VQDEVINF.TXT), with the name and the
version of the GDOS you use (NVDI, SpeedoGDOS...).

best regards,
Arnaud.

5626. Parallel port reading

Newsgroup: comp.sys.atari.programmer
Date: 2003-05-24 14:59:15 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3ecf96b814fc9aa0@tripnet.se>
Source record: 495
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

I'm searching for an ST program that can read data from the parallel port and act exactly as a printer. I would like to capture printouts from an old computer with no other interfaces to salvage some source code.

The alternative is to print on paper and then use a scanner and OCR but it takes a lot of time and some OCR errors might ruin the sources.

It should be possible to read the printer port but what about manipulating the (crossed) strobe/busy lines?

Does anyone knows of such a "printer emulator" program and where to download it?

If not, I might even try to write one myself. It is possible to read the printer port but I'm uncertain if it will work to simulate the strobe/busy handshaking by manipulating the sound chip registers.

I tried this a long time ago and managed to read the first byte in GFA but never got the other computer to send any more data. Maybe all that is needed is a small ASM routine to toggle the handshaking so the built in routine can read the next byte?

If anyone knows of a similair solution for PC I can use that as an alternative. Perhaps even better as this eliminates the risk to blow the Atari printer port...

Sounds like a rather round about way to save some files. But if I was to make a suggestion, I'd setup the machine for a serial printer. I've never dealt with the parallel port, but the serial port I've done alot with. Maybe a cpx or some old desk acc from Atari would let you set the port for sending stuff to a printer. It's an idea anyway.

This computer has two ways of sending data:

1. Parallel port in ASCII format.

2. 300 baud analog suitable to record on a cassette tape.

So, I prefer the first method...

This definitely is possible. PARCP uses the printer port for transfers
and so does the Portfolio and STBook data transfer utilities.

I don't need any high transfer speeds, only error free.

I have found some hints on Google about how it might be done.

To my surprise a search for a PC program capable of this returned
nothing...

There might also be a possibility to use a parallel to serial converter
but I guess those are both hard to find and expensive.

Hello

Can you please try the next release of my test program :
http://arnaud.bercegeay.free.fr/gemlib/vqdevinf2.zip

Done and trouble is the same : after I got a normal window with lots of writings in it the computer reset.
I thing the trouble only come when the programm tries to write a file.

My config : H60 with caches off (for tests), et6000, nova vdi 2,61 and everythings running on the ramdisk.

Regards

5633. Modula-2 POSIX package

Newsgroup: comp.sys.atari.programmer
Date: 2003-06-04 18:41:53 UTC
From: Christoph Schlegel <modula2@myrealbox.com>
Message-ID: <20030604204232.722098c1.modula2@myrealbox.com>
Source record: 252

I'm searching for a package called M2POSX14.ZIP,
it is written in Modula-2 and contains implementation
of some POSIX system-calls.

I found the package at
http://www.spythis.com/cca/32.html
(the Crawly Crypt Software Archives)

The link on this page points to
http://crawlycrypt.chromagic.net/CCC1/PROGRAM/COMPILER/M2POSX14.ZIP
which is not (no longer) available.

Does anyone still have the package? Or does anyone know where I
can find it or even search for it? Any idea/help welcome.

Thanks in advance,
Christoph

Wow! Is there any chance for me to get the M2POSIX-archive?
(I don't know how many crawly-crypt cds are there... is it much
work to find a special package and so on...)
It would be more than kind if you could email the
package... I'd be really grateful. Don't know what I could
offer for it -

Thanks in advance,
Christoph

Thanks for answering!

My adress is:
modula at myrealbox.com

I'd also give you access to a ftp-account
of mine if the package is too big.

I think the file would be really useful as a
starting point to develop a POSIX library
(as exists for a commercial compiler)
for the GNU Modula-2 compiler. That's why
I'd like to have it - just thought I'd
explain. If the copyright allows it, I'd
offer the package for download from the
Free Modula-2 Pages I maintain.

Regards,
Christoph

Yes there is a CD-ROM version, copyright 1996, Toad Computers, Inc.
I have seen this for auction quite often on eBay (where I obtained
mine).

>I have _very_ basic knowledge in Assembler programming so there may be a
>lot of severe errors in my code! I'm also going away for a few days

Yes, there were quite a lot of errors in that code... :-)

I have now managed to get a working GFA Basic app that reads the parallel
port with an assembler inline hooked to the centronics interrupt. It does
seem to work fairly well when sending from a MSTe and receiving with a
TT. With the TT running standard TOS 3.06 I managed to transfer a 13 KB
file without errors.

With the TT under Magic and the rest of my standard setup with STinG and
everything I got two errors at one point in the file.

However... The reason for writing this program was to be able to transfer
files from my old Casio PB-770 pocket computer but that does not work so
well...

All data arrives on the Atari but every byte with the upper 4 bits
stripped to zero! Strange... Maybe there is a timing problem but I've
seen this behaviour all the time even when trying to poll the printer
port. I'm beginning to wonder if the Atari draws too much power on the
datalines or something. All three computers still print perfectly when
attached to a real printer, though.

Anyone with an idea of what could be wrong?

I have put up my GFA app with all sources included at:

http://atari.mine.nu/read_prt.zip (13.1 KB)

My ADSL ISP has "severe problems all over the country" so my server above
is down... Yesterday was Midsummer Eve here so I guess the technicians
are all sleeping after too much to drink... It may take some time to get
it fixed.

I have put a copy at http://www5.tripnet.se/~kennethm/read_prt.zip

Btw. STinG is really nice. To switch from Ethernet to modem you just have
to load another DIAL.SCR and dial in to another ISP without making _any_
config changes. After next reboot my TT will be back with Ethernet DNS
servers etc.

Not sure really, but I would use PARCP which does file transfer
through the Parallel printer ports quite nicely.

Well, there is no PARCP client that runs on a Casio PB-770... :-)

But, If there were a "One way printer emulation" mode in PARCP... I have
only read the online documentation for PARCP and can't find anything
about such a mode.

5647. Limiting memory for a program

Newsgroup: comp.sys.atari.programmer
Date: 2003-06-21 22:10:11 UTC
From: vdjole@EUnet.yu
Message-ID: <bd2l41$3a7$2@news.eunet.yu>
Source record: 266

Hi;

I would be thankful for some hints on the proper way to limit memory
permitted to a program to be started in a multitasking environment
(e.g. Mint or Magic, and the parent is supposed to be a shell aplication).

Thanx in advance.

Cant get to any books at the mo, but isn't that what the malloc and mxalloc
calls are for?

Initially the user app owns all available memory until its returned i
believe

Hi!

SS> Cant get to any books at the mo, but isn't that what the malloc and mxalloc
SS> calls are for?

I think, he wants to enforce that a program CANNOT allocate all memory.

I remember that there have been some dedicated programs for this purpose,
kind of wrapper app that just starts to launch the application that should
have restricted memory. You could search FTP servers...

Well, and now I have done some research myself. For MagiC look for
LIMITMEM, there also is a GEMDOS call (102, Psetlimit) that allows for any
process to change its limits. This could be used by the "wrapper" app.

Regards,

Alexander

If you use Thing or jinnee as a desktop, the Show Info/Information
dialogs allow you to input a MagiC memory limit for any application.

I know that Thing and Jinnee can do that, and I was trying to do exactly
the same myself, i.e. to start a program so that it could not eat
memory above some limit. As far as I understand Psetlimit(...) allows a
program to impose memory limit upon itself or its children, so I tried
something like this:

```
Psetlimit( 2, 100000L ); /* to impose limit upon myself and my children */
...
shel_write(...); /* to start a child */
...
Psetlimit( 2, 0L ); /* to cancel the limit ? */
```

but still a naughty program which I start uses all memory (tried in Magic),
so either, and much more probably, I am not doing it right, or the
started program does not heed the limit.

regards;

This won't work, as programs run via shel_write() are children of
the AES, not of your program.

To achieve what you want, you need to use the extended
shel_write() modes which (among other things) allow you to specify
a memory limit for the program being run.

Ciao

5653. OGG replay on 68000?

Newsgroup: comp.sys.atari.programmer
Date: 2003-06-27 10:42:22 UTC
From: George Nakos <ggn@atarirocks.org>
Message-ID: <oprre9cwtq0mms9a@news.ntua.gr>
Source record: 272
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

I have been pondering on the matter of poritng the Ogg Vorbis replaying routine to 68000. I have downloaded all the sources from xiph.org, including a player which uses integers only, but I have some problems.

Mainly, the integer only routine is 64-bit only and I can't modify anything since my C knowledge is quite bad. On the other hand, I have quite some skill in 68000 assembly.

Now, a weird thought crept into my mind one night. Why not compiling the Ogg sources on a standard Atari Compiler, and then reverse engineer the executable to see what happens? I'm not talking about real-time performance here, just loading and unpacking the file into memory. But my absymal C knowledge (see above) restricts me from doing that.

Hence this post. Is anybody out there willing to assist me? All that he needs to do (which is indeed a Herculian task for me) is to modify the sources a bit so that they will do what I described above (just load/unpack file), and then send me the executable (the modified sources would be nice too), so I can reverse engineer it and code it a bit better (if possible).

Any help would be appreciated. (please note that the minimum target machine is a standard 4mb ste - it will be of course upwards compatible).

Aniplayer at http://aniplay.atari.org/ will decode (and encode) Ogg files
on a 68020. Maybe you could go on from there.

From the Aniplayer package:

Ogg Vorbis 'Tremor' integer playback codec library, version 1.0.0.
http://www.xiph.org/

Here's a shared library of libvorbis-1.0rc2. It has been compiled with
Gcc 2.95.2 with -m68020-60 and works only under MiNT 1.15.3 or more and
MagiC 6. TOS cannot load .SLB, but an SLB loader exist with MetaDOS:
ftp://ftp.uni-muenster.de/pub/atari/Utilities/slbld028.lzh
http://www.muenster.de/~reschke/soft_e.html

Requirements:
- 68020 or higher
- MiNT 1.15.3 or MagiC 6 or MetaDOS 2.74.

You're asking for an awful lot. I hope you don't expect real-time
decoding and playing without specialized hardware as a typical 68000
processor isn't enough. Even a 68030 just isn't fast enough hence the
Falcon must use DSP support. But actually AFAIK there is no OGG vorbis
DSP support yet in Aniplayer so mp3 is the way to go for real time
playback on the Falcon. The 68060 however I suspect will not even burp at
playing back an MP3/vorbis file.

If you simply just want to decode and don't care how long it takes,
Kenneth's suggestion of Aniplayer is the way to go and I'm sure the vorbis
stuff could be compiled for 68000.

I recently tried to play an Ogg file from the last ST Computer CD in
Aniplayer, but it could not be started - the dialogbox came up OK
but clicking on the play arrow did nothing at all! Any ideas? his
is on a Falcon and MagiC 6.01, witth VORBIS.SLB and VORB_ENC.SLB in
the MAGIC\XTENSION folder.

Regards, /Peter/

FPU?

Ogg works fine here on a TT, both encoding and decoding. But slow...

Geneva lets you do that easily, but since I have gotten Magic and
Mint, I have 256 meg of memory, so that is not needed. I have not
seen that option for Magic/Mint, but I would assume that it can be
done.

Humm...
You need lot of power for ogg vorbis, more than mpeg audio layer 3.
I have compiled the vorbis integer library (with Gcc 2.95), I obtain 50%
of load under MagiCMac and a PPC G3 500 MHz.
I have compiled the normal vorbis library for the 68060 (with Gcc 2.95),
I obtain 80% of load under my Falcon/CT60 (68060 66 MHz).
I cannot rewrite the library for the DSP because Ogg Vorbis need lot of
memory.

I don't know if you can overclock the 68000 to 500 Mhz.

Regards,

Didier.

Didier,

Using more advanced DSP's like 563xx and such would you be able to do it
on those? I would imagine that those have more on chip memory available
inside the DSP.

Thanks

Thanks for replying (and sorry for my late reply), but I just need an off-line unpacker, not a realtime streaming application.

All I need are sources for ogg that a) can compile to standard 68000. b) A (very small) routine to load & call the ogg "depack" routine. Could anyone direct me to such sources? (that was kind of my original request)

Thank you...

Under MagiC you'd use the application prefrences of that particular
program. Under MiNT I'd imagine you'd use some form of ulimit.

5666. gemlib 0.42.99-20030714 released

Newsgroup: comp.sys.atari.programmer
Date: 2003-07-15 20:53:06 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@free.fr>
Message-ID: <oprsddmsmfbi3vdq@news.free.fr>
Source record: 285

Hello,

gemlib beta release "14th july 2003" is here
http://arnaud.bercegeay.free.fr/gemlib

You'll find there the sources (tgz), and the library already compiled for
purec, sozobonx, gcc 2.95 and gcc 2.81 (zip).

For sparemint users, a RPM is available here:
http://sparemint.atariforge.net/beta/

For more details, the ChangeLog is at the usual place
http://sparemint.atariforge.net/cvs/ChangeLog.lib

Please, test this lib and report any pb.
If all is ok, this beta release will become the next official gemlib
release 0.43.0.

best regards,
Arnaud.

Hello Group,

I longkept dream has been fulfilled yesterday. I got a Falcon! Because I am a total Atari Newbie I'm searching the web for Informantions, HowTo's, etc... But those doc's don't answer an important question:

I would like to use it for programming (have touched the 68k during my job), but don't know which language to chose. My job requiers Ada, so I want a different language;-)) As far as I know till now a typical choice would be GFA-Basic and an Assembler. Any other suggestions?

Thanks a lot

Kai Schuelke

If you go for GFA-Basic, a good place to start looking for tutorials
and patches is Lonny Pursells website:

http://www.q1.net/~atari/

HiSoft Basic is very good.

Also try Lattice C.

I am selling all my Lattice C books and software.

Check ebay.

I always wanted to have a look outside the mainstream, but till few years ago my parents bought my computers for me ;-))
But i kept reading all sorts of books and magazines. The ones that interested me most were the Falcon and the Acorn Archimedes / RiscPC series. I don't want to spend several hundred Euros/$ for a "toy" (I do my work on PC, and that works for me). On saturday I finally stumbled across a never used and original packed Falcon with a SM144 for 25Euro, so I couldn't resist. That's all the story...

So could you recommend me a good/useful/"widespread" software-setup for programming the beast?

```
Ah! for 25 euro, I would definately buy a falcon!!!
I use to own a STFM, I programmed it using GFA basic and C, not sure what C
compiler I used, though, it was a free compiler...
The fact that I didn't have a colour screen and the fact that at my work (at
the time) we use X windows, made me switch to linux at home. PC hardware was
the best choice to run linux so, thats where my atari was left behind....
Falcons and TT's were too expensive, so I never owned one....
```

Using SM144 you will not ess much. You may connect your Falcon to TV Set, or VGA monitor (but this will require interface like for SM144). There you will have color modes and all fun.

The best choice is special multi-sync monitor that ia able to work with vertical frequencies starting from 15kHz (ordinary VGA can do from 31kHz up).

Assembler is a lot of fun! Have a look here:

http://www.dhs.nu/files_code.php

I always use the Turbo Assembler (very very good!) for 68K and DSPdit
with QuickDSP for the DSP. Both together are a relly powerful combination.
I think the link above only contains the ST/TT-Version of TurboAss.

Here should be the Falcon-version:

ftp://ftp.inf.tu-dresden.de/software/atari/Programs/Programming

Additionally there is bugaboo, a very good debugger.

Greetings,
Matthias

If it is running Windows 95 it will read it. Anything else might, but try
opening it in Explorer, because some apps will not read it directly.

I do not know what program is required if those suggestions do not work,
but they have been posted in this group before, and may be posted again.

5679. Printer drivers

Newsgroup: comp.sys.atari.programmer
Date: 2003-08-17 21:09:56 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3f3fd304.0@entanet>
Source record: 298

Hi all,

In my office, I was asked to do some set-up work on a Linux
PC (SUSE). Part of the set-up was to get the printer working
with CUPS (Common Unix Printer Service or something like that).

CUPS provides Linux with printer support for hundreds of printers
so I became interested. Presumably the FreeMint developers have
heard of CUPS but it was new to me.

I had a quick look on a Linux website to see what was required to
install CUPS. Much of the software has all ready been ported to
FreeMint but I didn't have time to check all the version numbers.

If it could be ported to FreeMint, and I realise that it would take
a lot of work to do this, I doubt it would work directly with GEM
but adapting a VDI to work with CUPS sounds more feasible
than writing printer drivers.

Is anyone considering this as a solution to the printer driver
problems ?

regards,

Peter

The PC will read it, but that is about it. If you want to run it,
I suggest either running an Atari emulator on your PC or else just
go out and buy an Atari.

Message-ID: <3F4484AC.6030503@club-internet.fr>
Source record: 352
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

Taking again the programming of Icon Extract after several tests for Rodolphe on the CT60, I will like to know if one among you know some routines of transfer of pallet of 256 colors towards another 256 colors. I am explained: by reading the pallets of the Windows icons to format ICO, CUR, and ANI, the pallet 256 colors is always different from that of Falcon. It thus should be adapted to just, my current routines try to find color RVB nearest and that functions well. I will want to optimize the speed of the treatment and I am certain that there is an algorithm already existing faster than mine. I search on Internet, but I anything out of C would you have do not find sought some tracks?

In the same way, I use my routines to transfer from the icons 24 and 32 bits to 256 colors. The more there are colors, the more the treatment is long to find value RVB corresponding. Also, if you have tracks (without using options of dithering), you would help me well. Thank you for your assistance.

Florent

I'm sure CUPS can fully be controlled by command line tools, but if there
are GUIs for this, it surely was nice to re-do them for GEM. And yes, that
was probably much simpler than writing a huge set of printer drivers...

PS> Is anyone considering this as a solution to the printer driver
PS> problems ?

I think it was a good approach!

Well then, you need to find someone who has an Atari who can read
it, then they could transfer it to a disk that is readable by your
PC. I could do it, if you want to send it to me. I could just
email you the contents of the disk in a zipped file.

Shdriver.sys does a check for the existence/status of a blitter and
depending on the result of this check prints either "Doing programmed I/O
for ide" or "Using blitter for ide access", but I've never heard read
anything that would explain why or how.

Now I can't find the link for the CUPS dependancies (typical
isn't it). I was hoping to be able to list what has all ready
been ported to Mint and the version number differences.

These links provide some basic information about CUPS:

http://www.cups.org/
http://www.cups.org/documentation.php

http://www.freshports.org/print/cups/

CUPS replaces the normal lpr printer commands so I presume
VDI would have to mimic the calls to CUPS made by unix
apps.

Regards,

Peter

```
Perhaps does it use the blitter to transfer from a buffer
to memory, though I don't think it'd much help on a Falcon...

Hi, Peter!

PS> Now I can't find the link for the CUPS dependancies (typical
PS> isn't it). I was hoping to be able to list what has all ready
PS> been ported to Mint and the version number differences.

debian-aptitude shows these dependencies for the cupsys package
(1.1.19final-1):

libc6 >=2.3.1-1
libcupsimage2 >=1.1.19final-1
libcupsys2 >=1.1.19final-1
libgcc1 >=1:3.3-0pre9
libgnutls5 >=0.8.0-1
libpam0g >=0.76
libpaper
libslp1
libstdc++5 >=1:3.3-0pre9
zlib1g >=1:1.1.4
gs-esp
adduser >=3.12
debconf >=1.2.9

PS> CUPS replaces the normal lpr printer commands so I presume
PS> VDI would have to mimic the calls to CUPS made by unix
PS> apps.

I'm not sure where the drivers themselves are located, but I assume that
it was sufficient to port the right library and use its functionality from
within a TOS app or from within the GEMDOS. So one does not have to bother
with the whole daemon- networking- and administrative stuff that comes
with CUPS.

Regards,

Alexander

It seems to me that's exactly what CUPS _is_. It's basically a really
fancy spooler, not a driver or a collection thereof. Most *nix apps
will create Postscript, which is directed by CUPS to the correct
location, whether directly to a Postscript printer or first through a
filter/driver like Ghostscript and then to a non-Postscript printer.

If you're looking for drivers, it seems to me a project like
Gimp-Print is a better place to start. See
http://gimp-print.sourceforge.net/.

Maybe I misunderstood the stuff I was reading but the article
was boasting abou how many printers were supported by CUPS and
how it replaces lpr. That is why I got the impression it
included drivers.

Earlier today I gleaned the info below from the FreeBSD website
and added my own comments.

I'm sorry if I accidentally mislead anyone by thinking CUPS
is a printer driver system. However, whatever Linux and BSD use is
probably a suitable way of getting support for a large number
of modern printers on the TOS platform.

Regards,

Peter

Combined List of 18 items:

FreeBSD FreeMint(SpareMint)
------- ------------------

cups-base-1.1.19.0,
cups-lpr-1.1.19.0,
cups-pstoraster-7.07,

autoconf-2.53_1, 2.57-1
expat-1.95.6_1, 1.95.2
fontconfig-2.2.90_3,
freetype2-2.1.4_1, 2.0.4
gettext-0.11.5_1, 0.10.35
ghostscript-gnu-7.07_3, 6.50
gmake-3.80,
imake-4.3.0_1,
jpeg-6b_1, libjpeg 6b ?
libiconv-1.9.1_1, 1.6.1
m4-1.4_1, 1.4.1
pkgconfig-0.15.0,
png-1.2.5_2, libpng 1.0.11 ?
tiff-3.5.7_1 libtiff 3.5.5 ?
XFree86-libraries-4.3.0_5, XFree-86-devel 4.0.1 ?

Obviously the 3 CUPS components have not been ported, that leaves:

7 items ported with 2 at the correct version (autoconf and m4),
none of the others are very far behind the versions required by CUPS.
I don't know how important the versions are.

I think the 3 graphics components (jpeg, png and tiff) as well as
XFree-86 have been ported but I am not sure because of the slightly
different names.

The 4 remaining (gmake, imake, fontconfig and pkgconfig) don't seem
to have been ported.

If all of these items were ported then I belive that CUPS could
provide printer support to X-window applications running in the
X emulator under FreeMint.

This is where my idea gets a bit vague. To be any use to GEM applications the VDI would need to interface to CUPS and use the GEM font files.

Also, performance may not be great but let's not worry about that just yet.

With a USB port and driver software this may mean an end to the problem of having to use old printer drivers with even older printers.

It *might* be possible, that there is something of use within SDL (http:/
www.libsdl.org) or one of its support libraries. One of the extra modules
adds support for extra file formats.

This is a good point as well...

Back to CUPS: Peters list makes me think that mainly cups-lpr and
cups-pstoraster packages will be needed for printing. That is not that
much. But still there has to be someone to do the port...

CUPS is only a printer framework that can be easily configured and
maintained through http.

Printer drivers are not part of CUPS itself (altough you can buy drivers).
Free drivers are mainly available through ghostscript and the gimp-driver
project. More informations are available on the linux printer driver
project site.

Sometime ago I compiled CUPS for FreeMiNT and got it working (the daemon
and the driver backends). It require lot of RAM, especially if you want to
print. Speed depend on the postscript rasterizer and is on an original
ATARI very slow (ghostscript it's not the fastest program).

Ciao

imake is part of XFree86, gmake is already available (the package is
called make). expat, fontconfig, freetype2, XFree-86-devel are not
strictly neccessary. Btw. libs like png, tiff can be easily upgraded.

I did this exact same task using linux just a few days ago. I dual boot into redhat, but you shouldn't have to do that to use linux.

You can get various very small distributions of liunux (i.e. 3-4 diskettes only) that install and run "on top of" DOS/Windows using the existing dos file system. Unzip the linux distro into a directory, run linux-start.bat (or whatever it's called), and it boots into linux using your dos/windows file system. Now mount the atari diskette and copy the contents into a directory. Now reboot and you're back to dos/windows, and the atari files will be there on your hard disk where you put them.

If you use dos to format a diskette with the right density then that can be written to by the atari and the files can be read later from dos without any trouble. (If you buy high density disks then you might have to tape over the high density hole before dos will format at a low density.)

The linux installed as mentioned above can be useful for other tasks or your own interest, and takes very little space.

I have very successfully used mini-linux from within dos for other tasks in the past. That distro is very old now, but there are also other newer distros that work the same way (i.e. they are small and require no changes to your dos/window system to install.)

^^^^^^^^^^^^^^^^^^^^^^

I knew it would be slow on standard Atari's but printing to high res
printers is slow on them anyway and they still have the option of
using NVDI or other GDOS replacements. I don't think anyone with an
ST will be printing an A4 image at 1400dpi ;-)

It would be great to have the option for people with faster machines
and I would love to be able to get the best out of my Canon when
higher quality output is needed. The NVDI drivers only work with
360dpi :-(

What do you think of the idea of linking the printer driver to the
VDI ? Do Gimp-print and Ghostscript just print the postscript output
from Unix apps ?

To use some of the cheaper printers there is still the problem of
USB but that's another thread.

Redards,

Peter

NVDI can produce an IMG file and I think it could produce
Postscript if the correct printer driver is installed but I
don't know if it can send this to a file.

I know it uses .SYS files for each of the drivers e.g. IMG.SYS
but there isn't a TIFF.SYS

A TIFF file would be huge though. I have a problem with printing
some documents because NVDI creates temporary files on my boot
partition which is only 64Mb. If I ever get my second disk working
reliably it will be 400Mb but other people will have similar
problems. I haven't worked out how to get NVDI to use another
partition (is it the SPOOLPATH ?)

I wonder if GIMP does something similar, converting PS
to TIFF to send to non-postscript printers ?

Hi!

GIMP can quietly generate PS and ghostscript will convert it to whatever
if required (IIRC this is the way it works in Linux/Unix).

BTW: I already had an idea to create VDI -> PS driver for fVDI. It would
be something like the ARAnyM screen driver, but the output would be
postscript.

best regards

STan

IMG is very unusable from the view of unix tools (I don't know any open
source converter that can read IMG).

> and I think it could produce
> Postscript if the correct printer driver is installed

I don't know about any NVDI/VDI related printer driver that create
postscript.

> A TIFF file would be huge though. I have a problem with printing

Btw. harddisc space, under cups the rasterizer for non postscript printers
(like ghostscript) will also completly buffer the rasterized printer data
on harddisc (for a decent resolution this are lot of megabytes).

> I wonder if GIMP does something similar, converting PS
> to TIFF to send to non-postscript printers ?

No, PS can be directly used (but in case of GIMP the PS only contain the
graphic data which is just a plain bitmap)

I thought so but it does show that it is feasible. It's a pity 2b aren't
contactable.

I am not clear anymore exactly what GIMP/CUPS/Ghostscript are doing.
Originally I thought GIMP was the driver software.

Hello,

I would like to check if the docs I have about MVDI support (special XBIOS functions for Milan VDI) are right. To this end, I need the drivers themselves. These ones, when installed, add a cookie _VDI. If you have a Milan, and these drivers, could you send it to me ? Thanks.

Hello!

> >I don't know about any NVDI/VDI related printer driver that create
> >postscript.
>
> Are none of the LaserJet driver PS ?

I'm sure that NVDI send rasterized data and no postscript.

> I am not clear anymore exactly what GIMP/CUPS/Ghostscript are doing.
> Originally I thought GIMP was the driver software.

This is a complex framework. CUPS is the manager: wait/enqueue/priorize
print jobs, invoke the rasterizer if neccessary and send it to the printer
(via various protocols, parallel port is only one method).

The GIMP drivers don't print directly to the printer, they only rasterize
the print job.

Ciao
...Frank

5706. Milan IDE DMA

Newsgroup: comp.sys.atari.programmer
Date: 2003-09-29 00:08:37 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3f775be5.0@entanet>
Source record: 375

I have found that one of the biggest bottlenecks on the Milan is caused by the lack of DMA when using IDE drives. Throughput is around 2000KBtye per second.

The SCSI driver uses DMA and can go up to 4.5Mb/s. It could be higher but is limited to asynchronous transfers. The only SCSI I have is an EZ Flyer so can't really confirm the preformance.

Is anybody in a position to create an IDE driver, like the SCSI driver, that would use DMA ? It's not an easy task I imagine but it would make a huge improvement in performance for disk intensive activities like playing mpg's and avi's with Aniplayer.

Regards,

Peter

5707. Announcement: cc65 v2.9.3 is out!

Newsgroup: comp.sys.atari.programmer
Date: 2003-10-16 16:57:49 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <dmimmb.4fb.ln@news.musoftware.de>
Source record: 376
Cross-posted to: comp.sys.cbm,comp.sys.apple2.programmer,comp.sys.atari.programmer,comp.sys.oric

I'm proud to announce cc65 version 2.9.3. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- The Commodore VIC20 (contributed by Steve Schmidtke <steve_schmidtke@hotmail.com>).

- The Commodore C64 and C128.

- The Commodore C16, C116 and Plus/4.

- The CBM 510 (aka P500), a quite rare Commodore machine (programs run in bank 0).

- The CBM 600/700 family (programs run in bank 1).

- Newer PET machines (not 2001)

- The Apple][(library support by Kevin Ruland <kevin@rodin.wustl.edu>)

- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler <cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga <taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).

- GEOS for the C64 and C128 (by Maciej Witkowiak <ytm@elysium.pl>)

- The Oric Atmos (this one is BETA!).

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

This is a maintenance release that contains bug fixes for version 2.9.2 (see http://www.cc65.org/bugs.php for a list). In addition, the current development versions of the ca65html and da65 applications (an assembler source to HTML converter and a disassembler) have been backported. Apart from these two exceptions, there are no new features in the release!

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target

systems you need the compiler RPM package *and* one of the target machine packages.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages.

Download:

For more information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Mailing list:

There is a mailing list for discussing cc65 related issues (programming, suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

Thanks to all who sent feedback and suggestions, and of course to anyone who helped developing cc65!

5708. Hotway

Newsgroup: comp.sys.atari.programmer
Date: 2003-10-24 22:11:16 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3f998764.0@entanet>
Source record: 377

Yesterday I wandered over to Sourcforge looking for some
software info.

On the front page there was an item about the Hotway Daemon.
It provides access to html mailboxes like Hotmail from a
normal pop3 mail program.

I wonder if this would work under Mint ?

One day I really must get the Freemint development stuff
installed, when I get the big hard-disk working that is.

Regards,

Peter

Just took a quick look. Not actually downloaded or tried it etc.

> I wonder if this would work under Mint ?

Theoretically it could, it being a daemon - shouldn't have too much in the way of runtime requirements, except maybe memory.

> One day I really must get the Freemint development stuff
> installed, when I get the big hard-disk working that is.

This is the best approach. You never can tell until you start compiling something. There are two dependancies mentioned on the web page - libghttp and libxml2. Probably be the dependancies for that pair which will be the deciding factor.

Hi All

I am hoping to get true ethernet networking on my Falcon and my TT. I am having a hard time finding a 'step by step' guide to implementing this using the built-in TOS, and harder time finding out how with alternate OS's that I can't seem to get much data on (MultiTOS, MiNT, MagiC).

I did find a couple of VERY simple ethernet interfaces that seem ideal to the task (they are so simple that the Atari 8-bit forums are using them with the 8-bit cartride port!) The links are:
http://www.embeddedether.net (about $50.00US)
http://www.embeddedethernet.com (about $70.00US)

Is there anyone in the 16/32 bit community that is familiar with these and/or has implemented them?

Is there any site that has a 'step by step' guide to getting an ethernet connection up? How about for file and printer sharing (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp, ssh)?

Has anyone used the 'LAN' port on the Falcon or TT to get netowking up with Linux (or other OS)?

Is there a more appropriate forum for these questions?

I have spent quite some time searching the internet, have I missed some usefull sites (probably...)?

I really want to get my Atari's talking to my Linux and Winblows systems, I have a Linux RAID 5 server with DAT backup and that is where I want to store most of my working files and software backups.

Larry

I'm not familiar with the interfaces to which you link, but there is a
project that provides Ethernet via the ST/TT's cartridge port or the ACSI
port:

http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm
http://hardware.atari.org/ether/index.htm

> Is there any site that has a 'step by step' guide to getting an
> ethernet connection up? How about for file and printer sharing
> (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp,

There's lots of software for doing many of these things, but I've not yet
dug into them much, so I can't provide specific pointers.

> Has anyone used the 'LAN' port on the Falcon or TT to get netowking up
> with Linux (or other OS)?

AFAIK, those ports are useless as anything but high-speed serial ports; to
the best of my knowledge, nobody's written any software to let them
function as network ports.

> http://www.embeddedethernet.com (about $70.00US)

The best solution atm. seems to be EtherneC device, see:
http://hardware.atari.org. It contains drivers for STiNG, MiNTNet and MagiCNet

> Is there any site that has a 'step by step' guide to getting an
> ethernet connection up? How about for file and printer sharing
> (Windows SMB, NFS, LPR) and/or internet access for downloads (ftp,
> ssh)?

For MintNet setup is similar to Linux (Unix in general) setup. For MagiCNet
it is Unix-like too IIRC, for STiNG it is diffrent (there are guides in the
STiNG package)

NFS and SMB filesharing is possible under MiNTNet, I do not know about
pritersharing, but should be possible too. Internet acces is not a problem
(all standard apps are ported, and there are native ones).

> Has anyone used the 'LAN' port on the Falcon or TT to get netowking up
> with Linux (or other OS)?

I do not know about such solution.

> Is there a more appropriate forum for these questions?

I do not think so.

> I have spent quite some time searching the internet, have I missed
> some usefull sites (probably...)?

http://www.google.com
http://www.atari.org

FreeMiNT (MiNT, MultiTOS, MiNTNet): http://sparemint.atari.org,

MintNet is going to be your most flexable as far as the networking goes.
I also understand there is a version of MagiCNet that is very close to
MintNet...in that it can use alot of drivers and such.

For MintNet...you get the standard Unix things.
NFS for mounting hard drive partitions (across other machines that support NFS)
http servers like apache.
telent servers
ftp servers
etc....

Clientwise for MintNet....you get the unix standards like lynx, pine, etc...
Some Xwin 11 clients can also run under MintNet.
With a socket called GlueStik you can also run most, if not all of the
STik/STing clients/servers with MintNet.

STing is also quite good, tho' you'll have to rely on ftp for cross platform
file sharing. Between the two Atari Boxes however, there is a drive sharing
utility for STing where one can mount each machine's drive partitions to the
other's desk top. I forget what it's called (BNet I think?), but I do know it's
out there.

On the server end for STing....
There is a basic http server.
A Basic FTP server.
And a utility for mounting TOS/GEM hard drive partitions across the LAN.
AFAIK there isn't any standard file sharing protocol for STing such as NFS.

I do belive that with the STing archive, there is information on how to network
TOS/GEM machines using MIDI, Serial, LAN, and even the Printer ports. A TCP/IP
link between the machines in essence. As for clients that work via the TCP/IP
ring...there is the BNet thing I was talking about, and your usual STing clients
and servers like ftp and http.

Unless you go with an ethernet solution, the easiest way to connect two Ataris, is using the MIDI ports. The fastest way is to build a special printer cable that connects the two via parallel ports. One can also use a null modem cable. It may even be possible to turn the so called apple talk (lan port) into a null modem type connection?

Brian

The LAN port is identical to and is wired to Modem 2. The only
practical use of this port is for connecting old Macintosh modems (you
don't need an adapter) or to avoid purchasing a switch box when you
have two serial devices (of course, only one can be on at any one
time).

Hello,

Check out the MyAtari online magazine site. In the October issue
there is an article I wrote called Broadband ST. I talk about
using the cartridge port of the ST to get access to the EtherNet.
This would also apply to the Falcon and the TT. I am using the
EtherNEC hardware device...

I am also looking to do this. I need a Ethernet adaptor though. I did some reading on getting a Ethernet-SCSI adaptor. There are some drivers that are avail too:

http://www.anodynesoftware.com/ethernet/main.htm

I was wondering if anyone else has done this and where can we get compatible adaptors?

Atari TT030 4/16MB TOS 3.06
Atari Falcon030 4MB TOS 4.02
Atari 4160STe 4MB TOS 1.62

Yes...I got my Dynalink adaptor from Roger himself at Anodyne, as he had a few in stock.
I've used it with my Falcon CT2B. It's not perfect, but yes, it does work, albeit you're limited to STing and possibly STik...unless someone has gotten around to doing mintnet drivers for the thing since I last hunted. I found this solution to be quite good and reliable for running clients. When running server software it gets a little iffy. I'm not sure if the server problems I had are specific to the Falcon with a CT2B...it just might work fine on other machines with a good SCSI host like the Link 96/97/ICD2, etc.

I also got an EtherNEC kit that plugs into the ROM/Cartridge port, and have used it successfully with both my Falcon and my MegaST. It has alot of drivers avilable for it for the various machines, OSes, and TCP/IP stacks out there. There is also a product similar to the EtherNEC, EtherNEA, but it plugs into the ASCI port instead of the ROM port.
http://home.arcor.de/thomas.redelberger/prj/atari/etherne/index.htm

There is also a kit someone did a while back that uses one of the parallel port adapators, lots of wires to various ports, and a hudge brick of an adapator. It's a pretty messy solution however.

Brian,

I hope you aren't talking about my attempt at creating a parallel port
adapter for the genius lan series. That was a prototype and a pathetic
one at that. The actual genius adapter by Elmar Hilgarte was a nifty
solution though seemingly a tiny bit more problematic than the IMHO
optimal ethernec solution. The ethernec worked without issue on my CT60.
That IMHO is the truest test ;-)

Well cool I will get one then if I can find one. There is one on eBay but
is missing the AC adaptor! I have a TT030, Falcon030 and 4160STe. But I
think I will just use this on my TT

A bit down on my list has been networking my Falcons with my PC after I finish recasing my Falcon in a Wizztronics case and installing my CT60 on top of my Nemesis Falcon. (My other currently running Falcon is a CT2B.) If I understand things correctly, the SCSI option with drivers from Anodyne will be limited to sting, which I used successfully with dial up. It would be a bit cheaper, depending on how much I'd get a SCSIlink for. That had been my first choice, since I didn't know how accessable my rom port was going to be after recasing. Not an issue now with my Wizztronics case, since I have the rom port extender and a cartmaster lite, allowing 2 carts. Now, I have 2 dongles, Steinburg and Soundpool, but I won't mind shutting down and rebooting when I want to switch. Now I'm curious if there is any performance difference between the rom port and scsi options? I've not yet gotten into mint, so that may be a consideration later. I've used MagiC for years. Anyone got and wisdom regarding general speed between the two? (Web browsing, file transfers, ect.?)

Wayne

[Post croisï¿½ FCSA,CSAP -> Transfï¿½rï¿½ ï¿½ CSAP]

Bonjour,

En convertissant un source assembleur 680xx pour Gcc
(Tetrax), j'ai remarquï¿½ qu'il y avait 9 instructions
Blo et 8 instructions Bhs, instructions 680xx qui
n'existent pas.

Gcc assemble trï¿½s bien le code sans warning.

En examinant le code de l'exï¿½cutable, j'ai trouvï¿½
qu'il remplace Blo par Bcs.

DevPac3, transforme Blo et Bhs en Nop.

DevPac2, convertit Blo en Bcs (Carry Set), Bhs en Bcc
(Carry Clear) comme Gcc.

Que signifie donc les instructions Blo et Bhs pour ceux
qui les utilisent(aient) ?

Par quelles instructions les remplacer correctement ?

Voici un exemple:

[...]

```
cd1loop2:
pea xbufptrs
move.w #141,-(SP)
trap #14
addq.l #6,SP

move.l sambuf_ptrs+4,d1
move.l xbufptrs,d0
cmp.l d1,d0
blo.s cb1loop2 <----------<<

move.l endofbuf,d1
cmp.l d1,d0
bhi.s cb1loop2

cb1ret:
```

[...]

Sinon, en regardant mon manuel du 68000 ï¿½ l'instruction
CMP, il est dit qu'il peut positionner le bit de

retenu du CCR.

Quelqu'un peut m'expliquer dans quelle condition une
comparaison peut positionner ce bit de retenu (carry) ?

Merci pour votre aide.

Jean-Marc

Selon toute logique :
BLO = Branch if LOwer
BHS = Branch if Higher or Same
le tout en non sign�

par analogie avec :
BHI = Branch if HIgher
et BLS = Branch if Lower or Same
en non sign�
qui existent bien, elles.

Dans ce sens, il me semble que BLO est bien �quivalent � BCS, et que BHS vaut BCC.

Dans le doute, tu peux toujours inverser les op�randes de la comparaison et utiliser un mn�monique standard 68k.

```
Ex :

cmp d1, d0
blo.s xixi
se transforme en
cmp d0, d1
bhi.s xixi
```

et dans le m�me ordre d'id�e

```
cmp d1, d0
bhs.s xaxa
se transforme en
cmp d0, d1
bls.s xaxa

--
```

Hello.

Is possible to change the flag SELECTABLE of a color icon object
during the runtime of a programm?

If the answer is "yes"......how??? :-)

Thanks.

David Galvez

Hi Lonny

> It's quite possible, in fact you can alter any part of an object.
> In GFA it's as simple as OB_STATE(tree_addr%,obj_number&)=new_state&.

Yes i know ob_state can be altered, but i mean ob_flags.
I was refering to the SELECTABLE ob_flag not the SELECTED ob_state.

Example:

I have a color icon that isnt SELECTABLE when the application starts, you click on it and nothing happens, and i want to make it SELECTABLE (flag 0x0001) in some parts of my application, then the user can click on it and the ICON will change.

> If you are not using GFA I can't give real examples, maybe someone else
> can. What language are using?
>
> --

I'm using C, i know about objc_change( ) AES function but i think only can change ob_states not ob_flags.

Thanks

OK i understand now what you mean.

May be there is a C library with a function like you were describing
(OB_FLAG), ii¿½m using Windom library and there isnt nothing similar, only
ObjcChange() that only change ob_states.

Anyway i found another way to do what i wanted using graf_mkstate(),
objc_offset() and objc_change.

Thanks again.

If i correctly understood, what you need is to set the DISABLED ob_state.
IMO, you don't need to change the SELECTABLE ob_flag.

BTW:

adr[obj].ob_flags |= SELECTABLE; /* set SELECTABLE flag */
adr[obj].ob_flags &= ~SELECTABLE; /* remove SELECTABLE flag */

HTH,
Arnaud.

5730. Color Icons flicker

Newsgroup: comp.sys.atari.programmer
Date: 2003-12-10 09:18:44 UTC
From: David Galvez <maaaaa@aaaa.com>
Message-ID: <br6ofd$4t9$00$1@news.t-online.com>
Source record: 398

Hi!

More about color icons.

In an application that ii¿½m programming i have some color icons in a window, when the mouse button is depressed on them the icon will change its form until the mouse button is released. Not always but sometimes during the redraw the icon flickers (iti¿½s possible to see during a short time a white form where the icon is, i think this is called flicker).

I have read about Xbios Vsync( ) used to code demos and games to avoid flickering, but i think this call does nothing in GEM programming, I put this call before an objc_draw( ) AES call and i couldnï¿½t see any benefit. Moreover i read many times Xbios calls must be avoid it programming "clean" applications.

Anybody nows any trick to avoid those flickers?

Thanks.

David Gi¿½lvez.

Obviously you can't use this as it stands but 'tis well enough documented to
show what wants to be done. Haven't been near this stuff in years:
basically 'wd[]' is an array of AES windows and 'wdi' denotes which one.
The 'wd_ob' member is an AES OBJECT[] structure. And, iirc, pug_edit
manipulates the visual state of the text cursor, pug_fredraw causes a
redraw of the OBJECT.

```
uint
pug_obflags(wd,wdi,obi,av,xv)
PUG wd[];
int wdi;
int obi;
uint av,
xv;
/*[ uint pug_obflags(wd,wdi,obi,av,xv)
PUG wd[];
int wdi;
int obi;
uint av,
xv;
```

wd[wdi].wd_ob[obi].ob_flags is ANDed with 'av' then XORed with 'xv' then the
result is written back to wd[wdi].wd_ob[obi].ob_flags which is also returned
to the caller.

In effect, this allows the ob_flags field of an object in the tree
wd[wdi].wd_ob to be read or written to. Any visual changes which are
required
will be performed.

```
]*/
{uint newstate =wd[wdi].wd_ob[obi].ob_flags;
bool turn_on =false;

newstate &= av;
newstate ^= xv;

if (newstate == wd[wdi].wd_ob[obi].ob_flags) return newstate;

/* check for edit cursor on -> off */
if (
(wd[wdi].wd_ob[obi].ob_flags & EDITABLE) &&
(!(newstate & EDITABLE)) &&
(wd[wdi].wd_edobi == obi)
) {

pug_edoff(wd,wdi);
wd[wdi].wd_edobi = NIL;
}
if (
!wd[wdi].wd_editing &&
(newstate & EDITABLE) &&
(!(wd[wdi].wd_ob[obi].ob_flags & EDITABLE)) &&
(wd[wdi].wd_edobi == NIL)
)

turn_on = true
;

wd[wdi].wd_ob[obi].ob_flags = newstate;

if (turn_on) pug_edit(wd,wdi);

pug_fredraw(wd,wdi,obi);

return newstate;
}

iirc...

```
while (mouse_button_is_down)
draw
;
```

...is gonna flicker like hell. Need to factor in some mechanism to
implement...

```
while (mouse_button_is_down)
draw_the_bugger_once_only_unless_dirty
;
```

...button coming back up perhaps. Others can fill in details, can't recall
the specifics myself.

> I have read about Xbios Vsync( ) used to code demos and games to avoid
> flickering, but i think this call does nothing in GEM programming, I put

> Moreover i read many times Xbios calls must be avoid it programming
> "clean" applications.
>
> Anybody nows any trick to avoid those flickers?

Re other thread. Here's some more. ;-)

```
void
pug_fredraw(wd,wdi,obi)
PUG wd[];
int wdi;
int obi;
/*[ void pug_fredraw(wd,wdi,obi)
PUG wd[];
int wdi;
```

```
int obi;

This call forces a redraw of an object and its children starting at
wd[wdi].wd_ob[obi] if at all possible. The redraw will take place if the
window
has been opened and has been been subject to at least one WM_REDRAW message.

Most notably, this call cannot be used after pug_new_dial() and before the
first call of pug_dialogue(), it will have no effect.
]*/
{Rect ob_rr,
wr,
rr;

/* ?is there any point? */
if (
(wd[wdi].wd_wh == NIL) ||
!wd[wdi].wd_redrawn
)

return
;

/* object clipping rectangle */
ob_rr = Objc_Clip(wd[wdi].wd_ob,obi);
/* window work area */
wind_get(wd[wdi].wd_wh,WF_WORKXYWH,PRECT(wr));

pug_edoff(wd,wdi);
graf_mouse(M_OFF);
wind_update(BEG_UPDATE);

/* walk rectangles */
wind_get(wd[wdi].wd_wh,WF_FIRSTXYWH,PRECT(rr));
while (rr.w && rr.h) {
/* ?do we redraw any part of this rectangle? */
if (rc_intersect(&ob_rr,&rr)) pug_redraw(NULL,wd,wdi,wr,rr);
wind_get(wd[wdi].wd_wh,WF_NEXTXYWH,PRECT(rr));
}

wind_update(END_UPDATE);
graf_mouse(M_ON);
pug_edon(wd,wdi);
}

Looks much more complex than it is, due to the callbacks...

void
pug_redraw(evmp,wd,wdi,wr,rr)
EVM *evmp;
PUG wd[];
int wdi;
Rect wr, /* work area */
```

```
rr; /* redraw area */
{int clip[4];
Rect dr;

/* clip redraw rectangle to screen */
wind_get(WH_DESKTOP,WF_WORKXYWH,PRECT(dr));
rc_intersect(&dr,&rr);

/* clip redraw rectangle to work area (safety) */
rc_intersect(&wr,&rr);

/* ?user supplied routine? */
if (wd[wdi].wd_fcp)
(*wd[wdi].wd_fcp)(PUG_NIL,evmp,wd,wdi,rr)
;

/* draw our bit */
objc_draw(wd[wdi].wd_ob,ROOT,MAX_DEPTH,rr);

/* ?text to draw? */
/* if (wd[wdi].wd_pgt) pg_redraw(wd,wdi,rr);*/

/* ?user supplied routine? */
if (wd[wdi].wd_fcp)
(*wd[wdi].wd_fcp)(PUG_ONE,evmp,wd,wdi,rr)
;

/* ?user supplied routine? */
if (wd[wdi].wd_fcp)
(*wd[wdi].wd_fcp)(PUG_TWO,evmp,wd,wdi,rr)
;
}
```

...EVM plays no role. It's an evnt_multi structure that app-supplied callbacks would have been interested in, maybe to aid in dealing with the precise problem you're having. Heck, I only wrote it. Doesn't mean I can remember!!!

```

This is what i did at the beginning and you are right it flickered as hell.

```
>
> ...is gonna flicker like hell. Need to factor in some mechanism to
> implement...
>
> while (mouse_button_is_down)
> draw_the_bugger_once_only_unless_dirty
> ;
```

What i do now....

```
draw_ changed_colors_in_the_icon
do{
get_mouse_button_state
}whlie ( mouse_button_is_not_released)
draw_original_icon_colors
```

Itï¿½s much better but still about 40% of the times the ICONs flicker a little.

I took a look into the source you posted here, i dont see how is done there to avoid flicker.
I will look at them longer this weekend.

Thanks for your help!

5735. Atari 400/800 files

Newsgroup: comp.sys.atari.programmer
Date: 2003-12-13 17:16:27 UTC
From: Tom Miller <tlgalenson@chatnfiles.com>
Message-ID: <vtmi8mn2pqrk3f@corp.supernews.com>
Source record: 304

A Motherlode of ms-dos files
Drop in and sit a while!

The Chatnfiles bbs (www.chatnfiles.com) is mainly known for having Chat and having Files. I offer a large (160,000+) and old files download collection. My oldest files date back to around or before 1988. I have both Carousel2 collection (1988) and the ms-dos portion of the Simtel ftpsite (on cd-rom) from about 1994.

The Carousel2 includes about 17,000 files. The target operating systems include: ms-dos, windows 2.11/3.x, Mackintosh (system 6?), OS/2,

Atari 400/800,

Comodore
64/128(?) and the Amiga. It also has about 5 different sub-directories with graphical files including both Gif and non-Gif formats.

The Simtel collection offers up about 10,000 ms-dos programs and files from on or before 1994. On a mailing list, it (and/or the Carousel2) were referred to as "the motherlode"....

I have a shareware collection called "Bobs Hall of Fame" that actually has Files for the Ibm System 3/A400 on it as well as more typical Ms-dos files...

I have a number of the Pier Shareware collections, Night Owl collections, Shareware Vault plus a number of singletons like Project Guttenberg, Nasa Space and Astronomy, Alan Appleton's BBS cd-rom, Best Windows games, Hot this that or the other.

You can use Google to search the local file area. Or you can simply browse the directories. The downside is there are no easy to use tools in the www server world to allow me to easily provide keyword access to the file collection. I am in the process of writing a script that will attempt to produce a "files.htm" page that includes file descriptions for each sub-directory that Google will read and produce a less garbled index of.

The website is running on a cpu/bandwidth throttle so it will not interfere with the other websites when lots of people are downloading. So it doesn't matter if 200 downloaders showup at once. They will get good service and so will the other sites.

The Chat system is running a perl script called Eileen, v2.1
which is derived from a popular chat script called Everychat.
It has multiple rooms and provides about 30 actions or
"emoticons."

The rest of the site is your basic personal website. I am
looking at upgrading to a product called AspPortal but the files
download indexing issue would remain. Drop on by.

I can't remember how GEM works that well. It might still be looping...

n=0;

[days pass] ;-)

Took me a while to figure it out, was looking in an example app for the button/drawing relationship which was wrong place. Seems pug is working more like a win32 message pump. Unless app registers an interest in an event it never gets told what's going on: things just get manipulated for it transparently. Essentially button is always in released state for the app. Doh! Anyways, once I tracked it down the code inside pug is a single line. Turns out the user's stubby fingers are the "antiflicker" code! The 'evm_button' member of 'evmp' is the button state from the evnt_multi() which lead us here...

do graf_mkstate(mouse); while (bs & evmp->evm_button);

...iirc 'Mouse' is peculiar to the MWC compiler and is a 'Prect'...

Mouse mouse ={&mx,&my,&bs,&ks};

...guess it'd look like this elsewhere...

int mx,my,bs,ks;
graf_mkstate(&mx,&my,&bs,&ks);

Pseudocode:
[One or more buttons go down]
oldstate = evmp->evm_button
do {
graf_mkstate(0,0,&newstate,0);
}while ((newstate bitwise-AND oldstate) != 0)
[all the down buttons of oldstate are now up]

At which point's its free to flicker again - except it can't 'cos user has to press a button to get back here.

I have been thinking to abandon the icons way and use bitmaps with
VDI.
My program also change the icon by itself without wait for the click
from the user...in this situation also flickers 40 or 30 % of the
times, so i think is something else than the evnt_button loop.

Thanks!!!

Hello,

For people insterested, you can grab it at:
http://bbs.dhs.nu/ct60/index.php?request=1012

Plus, there is an driver that provides XBIOS extension for Milan
(apparently only for S3 Trio 64) and gives complete control to
setup video modes for the video card.

Spam from VoteNader.org? (Or naderexplore04.org)

You may have received spam email recently that appears to come from our campaign, or be about our campaign -- perhaps the "From" and or "Reply-to" addresses look like they are coming from VoteNader.org. Or perhaps you have received a message that appears to come from an individual (if the address is real, the real owner probably did not send this email either) with suppressed recipients. Or maybe you received an email that appeared to come from yourself promoting our site.

These messages are NOT from Nader for President 2004, and these email tactics are NOT condoned by our campaign in any way.

UPDATE: Some of the latest forged emails have been made to appear to be coming from naderexplore04.org. Again, we are not responsible for this unfortunate abuse of email, and there is little in the technical sense that we can do to prevent this as it has nothing to do with our actual infrastructure. We are collecting information.

NOTE: The emails with malicious code (viruses, worms, etc.) often have attachments. Our campaign will NEVER send attachments in our announcement emails to you. Please be sure that you have anti-virus software and have the latest updates available for your anti-virus software.

Our hosting service has alerted us to say that Nader for President 2004 appears to be the target of what is called a "Joe Job." Such an event is where a spammer forges email to make it appear to have come from some other domain (such as ours -- or yourself). This is hard to prevent on our end and part of the insecure nature of the email protocol in general.

Members of our actual email list must request to receive email from us (either through Ralph's signup sheets or subscribing during our exploratory phase, or now on our campaign site). When one signs up for email they must reply to a confirmation message before they receive our list announcements.

Our public announcement emails come from "campaign@votenader.org," contain a "Paid for by Nader for President 2004" statement at the bottom, and have "updates@lists.votenader.org" in the "To:" header. Unfortunately, some of these indicators can be forged as well.

Most of the Spam that we have received complaints about appear to be forged from email addresses not associated with votenader.org (often forged to appear to be coming from government email addresses), and have

our website code embedded in the body of the email with hidden tags that contain random words that work to subvert anti-spam software.

If you are on our lists, you can ALWAYS unsubscribe at ANY time by following the instructions included at the end of our announcements. You can also use our unsubscribe page using the email address you signed up with.

If you are receiving this SPAM, we extend our apologies.

We will pursue the spammers to the full extent of the law.

For more information, please review these resources:

How Do I Determine the Source of an Email?
http://www.aota.net/Email_Spam_Prevention_and_Mgmt/emailsource.php4

give biological and chemical weapons
to children they don?t think twice. Sad but true.

Cops tried various things, by the way Jews had their brothers inside ASIO too, who were telling Mahmud Kurchu exactly what was going on, later they tried to make me stay with an Irani Jewish family under the witness protection program, it was sister Maryam who was angry about it and stopped all these "dumb" moves by police, I really thank her for that. I +vely identified all these people they brought it claiming these guys were my parents, I told them I am Muslim though I did not remember much.

As everytime I woke up I wanted to go back to school, as I couldn?t remove those hand cuffs in dream, I would start crying and so, during the mean while Mahmud Kurchu made changed the story about those two Jewish terrorists, they told the world these guys died in car accident. So these cops started giving me more injections to erase my memory as well, as I wasn?t forgetting Jews who raped my body and kidnapped me, they gave me these injections thrice. They told me all these things happened to me because I was hit by car, I was involved in car accident

etc.

Acutally there were times when I had to do investigation for that cop, like he believed Mahmud Kurchu?s statement that Dog bit his nose off, I told him what kind of dog would bite a nose and not the feet or so. And even if that Arfff :).

So after a few days they pealed my skin from my legs and covered the marks of cuts around my body. Today I have no sign of any operation on my body. Then they moved me back to the my garage room, one day the CIA guy came in. I regonised h

5748. TRY THIS!! IT WORKS!! MONEY$$$ NOW!!

Newsgroup: comp.sys.atari.programmer
Date: 2004-05-12 20:04:16 UTC
From: "B. Curry" <bcurrytw@carolina.rr.com>
Message-ID: <4rvoc.38720$jU.2327058@twister.southeast.rr.com>
Source record: 317
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.att,comp.sys.be.advocacy,comp.sys.be.help,comp.sys.be.misc,comp.sys.be.programmer,comp.sys.cbm,comp.sys.cdc

TRY THIS!! IT WORKS!! MONEY $$$ NOW!I COULD NOT BELIEVE IT!! I ACTUALLY RECEIVED MONEY! Here are the 3 easy steps to success: STEP ONE: Get 6 separate piece of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 12 US$ and place TWO inside EACH of the 6 pieces of paper so the $2.00 will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the envelopes and seal them. You would now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and $2.00. What you are doing is creating a service and you are paying for it! Like most of us I was skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office 1-800-725-2161 and they confirmed that it was indeed legal. Mail the 6 envelopes to the following adresses: 1. MANUEL TINAJERO/542 HERNANDEZ/ LAREDO/TEXAS/ 78046/ U.S.A 2. R.C FAULK/ 7509 NE VAN MALL DR. C-13/ VANCOUVER/ WASHINGTON/ 98662/ U.S.A 3. ZACK LONGLEY/7686 CALLAGHAN RD. APPT 3304/SAN ANTONIO/ TEXAS/78229/U.S.A. 4. MAURICIO LIMA/ 4221 AGUSTIN MUNOZ MONTEVIDEO/11900/URUGUAY 5. E. SIMON/ 1849 SEDGWICK AVE/ BRONX/ NY/10453/ U.S.A 6. B. CURRY/ 14923 JERPOINT/ ABBY DR./ CHARLOTTE/ NORTH CAROLINA/28273 STEP TWO: Now take the #1 name off the list that you see above, move the other names up 6 becomes 5, 5 becomes 4, etc., and Add YOUR NAME as number 6 on the list. STEP THREE: Change anything you need to, but try to keep this article as close to the original as possible. Now, post this amended article to at least 100 newsgroups. (There are close to 450,000 groups on Yahoo Groups alone). All you need is 100, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Internatational Postal Lottery Act. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keeps the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 dollar bills in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and directions carefully followed, six members will be reimbursed for their participation as a List Developer with two dollars each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving tens of thousands of dollars in CASH!!! What an

opportunity for only $12.00 ($2.00 for each of the six listed above) Send it now, add your name to the list and your`re in business! NOTE: Send only US dollars in this program as the US dollar always has a stable exchange rate and is easily available to peoples outside the U.S. If you live outside the U.S. then please exchange local currency int 12 US$. Exchanging money int $ is cheap, easy and can be done at most banks, post offices, embassies even super markets. It will all be worth it when you start receiving thousands of dollars in the mail. Also letters to places other than your own country, it is a good idea to send them airmail not by land, there is not a lot of difference in price for this. POSTING TO NEWSGROUPS********** STEP ONE: You do not need to type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter, drag your cursor to the bottom of this document, and select `copy` from the edit menu. Open a blank `notepad fill

> these 50 new people will make 250 postings each with your name at #3 or
> 10,000 postings. Average return, 500 people= $500. They make 250 postings
> each with your name at #2= 100,000 postings=5000 returns at $1.00
> each=$5,000.00 in cash! Finally, 5,000 people make 250 postings each with
> your name at #1 and you get a return of $60,000 before your name drops off
> the list. And that's only if everyone down the line makes only 250
postings
> each! Your total income for this one cycle is $55,000. From time to time
> when you see your name is no longer on the list, you take the latest
posting
> you can find and start all over gain. The end result depends on you. You
> must follow through and repost this article everywhere you can think of.
The
> more postings you make, the more cash ends up in your mailbox. It's too
easy
> and too cheap to pass up!!! So thats it. Pretty simple sounding stuff,
huh?
> But believe me, it works. There are millions of people surfing the net
every
> day, all day, all over the world. And 100,000 new people get on the net
> every day. You know that, you've seen the stories in the paper. So, my
> friend, read and follow the simple instructions and play fair. Thats the
> key, and thats all there is to it. Print this out right now so you can
refer
> back to this article easily. Try to keep an eye on all the postings you
made
> to make sure everyone is playing fairly. You know where your name should
be.
> If you're really not sure or still think this can't be for real, then
don't
> do it. But please print this article and pass it along to someone you know
> who really needs the bucks, and see what happens. REMEMBER....HONESTY IS
THE
> BEST POLICY.YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS! GOOD
> LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL
> INSTANT FREE CASH! *** By the way, if you try to deceive people by posting
> the messages with your name in the list and not sending the bucks to the
> people already included, you will not get much. I read someone who did
this

> and only got about $150 (and that's after two months). Then he sent the 5
> bills, people added him to their lists, and in 4-5 weeks he had over
> $10,000! TRY IT AND YOU'LL BE HAPPY!! GOOD LUCK TO YOU ALL!!
>
> HOW TO DO THIS: If you have Netscape 3.0 do EXACTLY the following:
>
> A) Click on any newsgroup, as you were going to look at it. Then click on
TO
> NEWS which is on the far left when you're in the newsgroup page. This will
> bring up a box to type a message.
>
> B) Leave the newsgroup box like it is. Change the subject box to something
> like ?Fast Cash? or ?Need cash?- Read here?.
>
> C) Tab once and you should be ready to type. Now retype (only once) this
> entire article word for word, except to insert your name at #5 and to
remove
> #1 of the list, plus any other small changes you think you need to make.
> Keep almost all of it the same however!
>
> D) When you are finished typing, click on FILE in this box (just above the
> send button... not where it says Netscape News on the first box. Now click
> on SAVE AS in the dropdown menu. Save your article as a text file in your
C:
> or A: drive.
>
> E) If you still have all of your text, send or post to this newsgroup now
by
> just cliking the SEND button (just below the File dropdown menu and above
> the Cc: button.
>
> F) Here's where you are going to post to 250 ore more, newsgroups... OK...
> click on any newsgroup then click on "TO NEWS"... again. In the top left
> corner of your screen. Leave the newsgroups box alone again, put a flashy
> subject title, hit tab once and your in the body of the message. Now,
click
> on the attachment file... now find the file that you just saved in the
> previous procedure. Click ONCE on the file and click OPEN and then OK. If
> you did this correctly, you should now see your file name in the
Attachments
> Box and it will be highlighted.
>
> G) That's it!!! Each time you do this, all you have to do is type a
> different newsgroup so you can post this message to 250 or more DIFFERENT
> NEWSGROUPS. I know, I know, you still have 249 to go, but it only takes
> about 30 seconds each, once you get the hang of it.
>
> Here it's a Write 3.0 format file [usenet.wri] with at least 1,600
> newsgroups addresses:

5750. STOS and AMOS game makers for Atari ST and Amiga

Newsgroup: comp.sys.atari.programmer
Date: 2004-05-19 17:08:17 UTC
From: *ProteanThread* <"moc dot sodtr at posys">
Message-ID: <2dd4573054698299d19e7507e9a9348b@news.teranews.com>
Source record: 319

Old timers are still alive!

Back in 1988 the Atari ST and the Commodore Amiga were the most advanced
home-computers available. IBM-PCs and clones were used mainly in companies
for business applications and the Apple Macintosh was much too expensive for
the average home user.

Fran&#65533;ois Lionet (one of the founders of Clickteam) produced with
Constantin Sotiropoulos one of the first game programming language ever
written: STOS Basic - published by Europress Software Ltd. It proved to be
an immediate success: STOS allowed anyone, regardless of their programming
experience, to have their first sprite moving on the screen with a few
instructions.

STOS filled a big gap in the market. Home users wanted to be able to
release their creativity and produce their own games without learning
difficult languages like C or machine code.

http://clickteam.com/English/amos.php

Today, Clickteam is proud to offer the source code of all STOS and AMOS
products as a contribution to the remaining Atari and Amiga community.
Clickteam is also willing to answer questions and queries about these
products through our discussion forums.

This reminds me -- for the past few years (on and off) I have been working a suite of portable tools for working with AMOS and its formats. In particular, amos_print can convert any AMOS source code to ASCII text, including code you thought you had permanently locked. So you can get back your code, even if you can't get AMOS running on an emulator and find some obscure extension that you're missing.

http://www.kyz.uklinux.net/downloads/AMOSutils.tar.gz

Interested people can also look at
http://www.kyz.uklinux.net/formats/amos_file_formats.html

Is there anyone who would like to help out on this? For example, to provide some of the extensions that are missing, versions of existing extensions that are missing, or to port this thing to handle STOS code?

Regards
Stuart

5755. [UPD] GEMLIB release 0.43.2

Newsgroup: comp.sys.atari.programmer
Date: 2004-07-12 20:34:15 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@freeyour_shoes.fr>
Message-ID: <opsa1krdk33qjehp@news.free.fr>
Source record: 324

Hello,

GEMLIB 0.43.2 is here !

This library is available for pure c, sozobonx, gcc 2.81 and
[cross-]gcc2.95
http://arnaud.bercegeay.free.fr/gemlib/

best regards,
Arnaud.

Hello there,

Can somebody give me some advice on the following matter.

I have an atari program which runs on a Atari TT.

I would like to run it on a windows and/or disassemble it.
I have found many rom and emulator programs for a ST but not for a TT, do
they exist ?

I have also a binary created file (from Atari TT) and the prg file.
Is it possible to disassemble one of the two (I would like to know the
structure of the binary file)

Thanks in advance,
Johan

I'm not sure if this is what you're looking for but...

A while ago, I was looking around, just seeing what other emulators were there for the ST, having gotten my ST back..
I found, I believe, a GNU source of of of the emulators that was basically supposed to multitask GEM on a 68k machine. A friend of mine looked over the code, as I don't program, and said it would need a little more than 8MHz to work properly and suggested a TT would run it properly.

I want to say it was either WinSTon, but I'm not sure and will investigate. Is this something you could use to maybe write a TT emulator? I think it was written in C++.

Just a thought from a sleep deprived lonesome male, looking for friends brit in NY <hey, it's free advertising space!>

You only need a 68K disasembler, ST or TT emulation is irrelevant. I you
want to run it, then try Aranym (search google).

> I have also a binary created file (from Atari TT) and the prg file.
> Is it possible to disassemble one of the two (I would like to know the

You dont disasemble binary files. If you don't know this, you are going to
struggle with some of the concepts needed. I recommend reading a good 68000
book first.

Coda.

5759. [UPD] Windom 1.21.1

Newsgroup: comp.sys.atari.programmer
Date: 2004-07-19 18:18:04 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@freeyour_shoes.fr>
Message-ID: <opsbec4eyo3qjehp@news.free.fr>

Hello,

Windom 1.21.1 is available for download on the sourceforge.net site

http://windom.sf.net

This is a bug fix version of windom 1.21.0

best regards,
Arnaud.

5760. xP(Almost FREE MONEY !! xP(

Newsgroup: comp.sys.atari.programmer
Date: 2004-08-04 05:43:11 UTC
From: John Meyer <meyer_j@allthis.net>
Message-ID: <V%9Qc.17198$a%1.16257@fe39.usenetserver.com>
Source record: 329

MAKE MONEY!!!

MAKE THOUSANDS!!!

I found this on a bulletin board and decided to try it: I don't care about
the useless pre-fabricated crap this message usually says. All I say is, it
works. Continue pre-fab crap.

WELL GUESS WHAT!!!

Within seven days, I started getting money in the mail!! I
was shocked!! I figured it would end soon, but the money just kept
coming in. In my first week, I made about $25.00. By the end of the second
week I had made a total of more than $1000.00!!

Let me tell you how this works and most important, why it works.....
also make sure you print this out NOW, so you can get the information off
of it, as you will need it. I promise you that if you follow the directions
exactly that you will start making more money than you thought possible by
doing something
so easy!!

Suggestion: Read this entire message carefully!! (Print it out or download
it)

Follow the simple directions and watch the money come in!! It's easy.
It's legal. And, your investment is only $6.00 (Plus postage) !!!

You can use any currancy as people can always change it..

IMPORTANT:

This is not a rip-off, it is decent; it's legal; and it is virtually no
risk - it really works!! If all the following instructions are adhered to,
you will receive extraordinary dividends.

PLEASE NOTE:

Please follow the directions EXACTLY, and $50,000 or more can be yours
in 20 to 60 days. This program remains successful because of the honesty
and integrity of the participants. Please continue its success by carefully
adhering to the instructions. You will now become apart of the Mail Order
business.
You are in the business of developing Mailing Lists. Many large corporations
are happy to pay big bucks for quality lists. However, the money made from
the
mailing lists is secondary to income which is made from people like you
and me asking to be included in that list. Here are the four easy steps to

success.

STEP ONE:

Get six separate pieces of paper and write the following on
each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST."
Now get 6 U.S. $1.00 bills and place ONE inside of EACH of the six pieces
of paper so the bill will not be seen through the envelope (to prevent
thievery). Next, place one paper in each of the six envelopes and seal them.
You now should have six sealed envelopes, each with a piece of paper stating
the above phrase, your name and address, and a $1.00 bill. What you are
doing is creating a service.

THIS IS ABSOLUTELY LEGAL!!!!!

You are requesting a legitimate service and you are paying for it!! Like
most of us I was a little skeptical and little worried about the legal
aspects of it all. So I checked it out with the U.S. Post Office
(1-800-238-5355)
and they confirmed that it is indeed legal!!

Mail the six envelopes to the following addresses:

Matthew Dutton
46 Hayworth St
Point Vernon, Hervey Bay
QLD, 4390
Australia

R. Visser
P.O. Box 274
Nobby Beach
QLD, 4218
Australia

S. Phillips
77 Manly Drive
Robina, QLD 4226
Australia

Chris Pittman
7651 Abigail Glen Dr.
Charlotte, NC 28212
USA

Mike Vango
29 Pebblewood Ave
Scarborough, ON M1V-2A7
Canada

C. Wehler
137 Sara Rd
St. Marys, PA 15857
USA

STEP TWO:Now take the #1 name off the list that you see above, move the other names up (six becomes 5, 5 becomes 4, and etc.) and add YOUR NAME as number 6 on the list.

STEP THREE:
Change anything you need to but try to keep this article as close to original as possible. Now post your amended article to at least 200 news groups. : (I think there are close to 24,000 groups) All you need is 200, but
remember, the more you post, the more money you make!! This is perfectly legal!! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal Lottery laws. Keep a copy of these steps for yourself and whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to directions. Look at it this way. If you were of integrity, the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you,> either on a computer or hard copy and keep the notes people send you.
This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft). So, as each post is downloaded and the directions carefully followed, all members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!!!

*****DIRECTIONS FOR HOW TO POST TO NEWS GROUPS!!!*****

STEP ONE: You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.

STEP TWO:
Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into the notepad so that you will add your name to the list.

STEP THREE:
Save your new notepad file as a text file. If you want to do your posting in different settings, you'll always have this file to go back to.

STEP FOUR:
You can use a program like "postXpert" to post to all the newsgroups at once. You can find this program at <<http://www.download.com>>.

Use Netscape or Internet Explorer and try searching for various new groups (on- line forums, message boards, chat sites, discussions.)

STEP FIVE:
Visit message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done.

Congratulations!!!!!!

THAT'S IT!! All you have to do, and It Really works!!!

BEST WISHES ...

ouYj\

5761. WinDom 1.21.2

```
Hello,

Windom 1.21.2 is available

http://windom.sf.net

This release fixes a bad bug (crash when userdef object are drawn under
TOS).

If you use windom 1.21.0 or windom 1.21.1, the update is highly
recommanded !

best regards,
Arnaud.

5764. File attributes and access rights

Newsgroup: comp.sys.atari.programmer
Date: 2004-09-18 09:13:53 UTC
From: vdjole@EUnet.yu
Message-ID: <cigu8f$nf5$1@news.eunet.yu>
Source record: 333

Hi;

I am not very familliar with non-TOS filesystems possible with Mint or Magic, so:

- Is there any filesistem used in which BOTH the DOS-like file attributes (system, hidden, archive...) AND unix-like access-rights (read, write, exec for owner, group, world) are relevant on the same item (file or folder)?

(of course, 'readonly' attribute can be related to read/write access rights and one can be 'faked' from another, but what about the complete set?).

thanx in advance.

cu;

Not on ext2 and minix (these filesystems only support the unix
attributes).

Regards,
Frank

Thanx; What about those enhancements of the FAT system (VFAT, etc.)?
Do they know of users and their rights?

Regards;

> Do they know of users and their rights?

No, VFAT is only a long name extension. But anyway, you should use the
operating system calls to get uid/gid and all the unix attributes and you
should not rely on a specific filesystem implementation or feature set.
Under FreeMiNT you can set a specific uid/gid as default for a (V)FAT
partition for example. It's the task of the operating system to map these
optimally.

Regards,
Frank

5769. pascal compiler or crosscompiler

Newsgroup: comp.sys.atari.programmer
Date: 2004-10-06 11:08:58 UTC
From: mrrik@hay.am
Message-ID: <88f41e4b.0410060308.82e300f@posting.google.com>
Source record: 338

Hello.
For few weeks I am an Atari 1040 ST owner and want to try develop
programs for this machine.
My preferred languages are Pascal and Modula-2 (for many reasons)...
So I am searching for a free pascal compiler and it's docs for Atari
ST.

Thank You very much

Hi, Norik!

n> My preferred languages are Pascal and Modula-2 (for many reasons)... So
n> I am searching for a free pascal compiler and it's docs for Atari ST.

Search the web for "Megamax Modula 2". This Modula 2 programming
environment has been made available for free by its author, Thomas
Tempelmann.

Regards,

Alexander

It depends on huge disk space, and I have only one floppy drive...
May be anybody have Pure Pascal warez, or FreePascal 099.5 version for Atari ST ???
```

Hi, Norik!

n> It depends on huge disk space, and I have only one floppy drive...

That's a pity!

n> May be anybody have Pure Pascal warez, or FreePascal 099.5 version for
n> Atari ST ???

Sorry, I don't have any Pascal compilers. But searching the net for
FreePascal I found this:

<http://www.templetons.com/brad/alice.html>

It might be worth a test...

Regards,

Alexander

Thank You very much...
I know about this program, but it is an interpreter...
Anyway, thank You... I'll try to buy something like hard drive on
e-bay some day... when i'll have card and money ;)

Sorry about that.

n> Anyway, thank You... I'll try to buy something like hard drive on e-bay
n> some day... when i'll have card and money ;)

Small Atari hard discs are not expensive at all - and they make the
programmers life a lot more comfortable. When I bought my Megafile 30
years ago I soon realised that I could not imagine how I could do without
before. Compilation seemed to finish immediately and switching between
applications (single TOS at that time) had an incredible speedup as well.

Regards,

Alexander

Prospero Pascal came on one or two floppies - iirc it would run off one floppy (with possibly a ramdisk though that may have been Prospero C).

5777. Atari ST programming hardware manual

Hi,

Thanks all for the links.
The link above is great but its very basic, there's no explanation, no
example for every topics and so on...
Do you know others site with the same topics but more developed ?

Thx

Sorry, it's just the book.
I can't provide any more info because I never used the machine.
I don't even have time to OCR any more of it.

5781. windom 1.21.3

Newsgroup: comp.sys.atari.programmer
Date: 2004-11-24 22:50:40 UTC
From: Arnaud BERCEGEAY <arnaud.bercegeay@freeyour_shoes.fr>
Message-ID: <opshzq2q0z3qjehp@news.free.fr>
Source record: 350

```
Hello,

windom 1.21.3 has just been released. This is a bug fix release.

More about windom here:
http://windom.sf.net

what's new:
- fix: 3D buttons of the font selector were smaller each time the font
selector
is invoked (bug fixed in the way OBJECTs are transformed to USERDEF).
- fix: restoring of the mouse form (if AES4_XGMOUSE flag is set)
- fix: area returned by WF_FIRSTXYWH is now intersected with the screen
area
(needed for some AES that returns area partially out of the screen when
the
window is partially out of the screen)
- fix: double call of functions binded to menu
- fix: redraw of menu in window under xaaes
- fix: drawing of children in ObjcDraw() with OC_OBJC mode

Direct link to the download page:
http://sourceforge.net/project/showfiles.php?group_id=68507

best regards,
Arnaud.

Hi;

How can the current Falcon-specific video mode code be inquired? I know of Vsetmode(mode) function which is supposed to return the previous video mode when setting a new one, but how does one just obtains the current mode without attempting to change it? I.e. is there something like Vgetmode() ?

thanx;

U use VsetMode with -1 as mode parameter (VM_INQUIRE) to get current mode
without changing.

I just had a look at the HiSoft site - they have Personal Pascal (never
used it, so I can't recommend or otherwise) going for ï¿½10:

There was a whole colection of very interesting books for the atari.
I lost all of them while shiping them from Australia to the USA many
years ago.
Some people may still have them. They covered topics ranging from
low-level programming to graphic creation and manipulation.

Does anyone have a complete image of MAPPIN06.IMG that is part of 'NVDI 4.1 Programmer's Guide' by Wilfrid Behne?

My copy is corrupted - it cuts off in the middle of ASCII 245.

If you have it, pleased mail it to me (I have no proper Internet access at present, only Cix, mail and Usenet).

I can't recall where I got it from, but quite possibly from there.
Unfortunately I have no web access at prresent, so can't check.

The images came with a text file NVDIGUIDE.TXT which is headed:

NVDI 4.1 Programmer's Guide
==========

Stand: 28.01.96 (vorl�ufige Fassung)

(c) 1995-96 by Wilfried Behne

which I translated into English and is available on Derrryck's
page, I think.

It had a MAPPIN folder with it containing MAPLIKE4.MAP and also
MAPPIN01...06.IMG files. The last one shows as 122,542 bytes but
Imagecopy reports it is corrupted and, as I said, it cuts off the
bottom of the table, from the middle of the lower part of the
integral symbol, ASCII 245. The other images are OK.

Can't check the RAR version you sent me by mail, since I don't
seem to be able to unarchive this :-(Is there an Atari program to
u npack RARs?

Regards, /Peter/

Look in chips n chips, an st-guide hypertext with most things atari har=
dware
covered. It is in German, but technical terms are much the same in Engl=
ish.
I did not find the latest version online, but I will upload it to ftp
chapelie.rma.ac.be as "CHIPS_X.lzh". Beware that it is 6.5MB in the las=
t
version, version X. There are older and smaller versions, also in other
languages, on that site already.

Cheers,
Mikael

5798. HXA Cross-Assembler V0.11

Newsgroup: comp.sys.atari.programmer
Date: 2005-03-26 06:40:25 UTC
From: Anton Treuenfels <teamtempest@yahoo.com>
Message-ID: <tt71e.5055$H06.4800@newsread3.news.pas.earthlink.net>
Source record: 217
Cross-posted to: comp.sys.cbm,comp.sys.apple2.programmer,comp.sys.atari.programmer

Posted a second version of HXA at:

www.home.earthlink.net/~hxa

Macros, conditionals, includes, etc. Knows a lot about real processors but little about real computers, so tries to provide some facilities to make it easy to adapt to real computers.

Fixed a couple of bugs. Added a few new pseudo ops. Added support for W65C816S processor to HXA65 variant. A bit faster.

GPL licensed freeware, source code provided.

Anton Treuenfels

I've just installed GCC and binutils to have a go at building an app
under Mint. SO expect lots of basic questions ;-)

I had a look for some docs that might be of help in starting off with
GCC an Mint but didn't find anything. Are there any good links ?

I am trying to build something called RRD Tool. The docs with the
source code said start with the command >sh configure and this
produced quite a lot of output before it failed and referred me
to the file config.log

This looks like the critical part of the file:

```
Reading specs from /usr/lib/gcc-lib/m68k-atari-mint/2.95.3/specs
gcc version 2.95.3 20010315 (release)
configure:2400: $? = 0
configure:2402: gcc -V </dev/null >&5
gcc: argument to `-V' is missing
configure:2405: $? = 1
configure:2428: checking for C compiler default output file name
configure:2431: gcc conftest.c >&5
/usr/bin/ld: cannot open crt0.o: No such file or directory
collect2: ld returned 1 exit status
configure:2434: $? = 1
configure: failed program was:
| /* confdefs.h. */
|
| #define PACKAGE_NAME "rrdtool"
| #define PACKAGE_TARNAME "rrdtool"
| #define PACKAGE_VERSION "1.2.0"
| #define PACKAGE_STRING "rrdtool 1.2.0"
| #define PACKAGE_BUGREPORT ""
| #define PACKAGE "rrdtool"
| #define VERSION "1.2.0"
| /* end confdefs.h. */
|
| int
| main ()
| {
|
| ;
| return 0;
| }
configure:2473: error: C compiler cannot create executables
See `config.log' for more details.
```

It is suggesting that GCC can't compile so maybe I am missing
some vital component.

Can anyone help ?

Peter

The info/man pages for g++/gcc should suffice. Similarly there should be
pages for the linker.

^^^
Check with MiNT folks that 'crt0.o' ought to exist. If it should then you're
missing part of the system installation (probably the part which contains
the linker).

Failing that, you can search the binary packages yourself. Example...

```
$ tar --list -zf rrdtool-1.2.1.tar.gz |grep "rrd_tool\.c"
rrdtool-1.2.1/src/rrd_tool.c
```

...if all your packages are in the same folder (and are bzips) this will
suffice...

```
$ for i in `ls *.bz2`; do tar --list -jf "$i" |grep 'crt0'; done;
```

```

The GNU compiler is only that - a compiler. The linker doesn't come with it because that's part of your system (MiNT itself).

I Googled the Sparemint packages and found that this file is part of
mintlib-devel which is obvious really.

I did the configure step again and it proceeded much further. Up to the
point where is was testing gcc IEEE math capabilities and the it said:

checking if IEEE math works out of the box... no
checking if IEEE math works with the -ieee switch... no
checking if IEEE math works with the -qfloat=nofold switch... no
checking if IEEE math works with the -w -qflttrap=enable:zerodivide... no
checking if IEEE math works with the -mieee switch... no
checking if IEEE math works with the -q float=rndsngl switch... no
checking if IEEE math works with the -OPT:IEEE_NaN_inf=ON switch... no
checking if IEEE math works with the -OPT:IEEE_comparisons=ON switch... no
checking if IEEE math works with fpsetmask(0)... no
checking if IEEE math works with signal(SIGFPE,SIG_IGN)... no
configure: error:
Your Compiler does not do propper IEEE math ... Please find out how to
make IEEE math work with your compiler and let me know (oetiker@ee.ethz.ch).
Check config.log to see what went wrong ...

I'm a bit surprised at this, I thought the Atari GCC was fairly standard.
Being new to this I am not sure if it is just caused by some missing DEFINEs
for Atari Mint specific stuff.

Anyway I've made a little progress.

Peter

Oki.

> I did the configure step again and it proceeded much further. Up to the

'configure' consists of a myriad of shellscript driven tests aimed at
tailoring the source such that it compiles upon your system. What you have
here...

> checking if IEEE math works out of the box... no
> checking if IEEE math works with the -ieee switch... no
> checking if IEEE math works with the -qfloat=nofold switch... no

> checking if IEEE math works with the -OPT:IEEE_comparisons=ON switch... no
> checking if IEEE math works with fpsetmask(0)... no
> checking if IEEE math works with signal(SIGFPE,SIG_IGN)... no
> configure: error:
> Your Compiler does not do propper IEEE math ... Please find out how to
> make IEEE math work with your compiler and let me know
> (oetiker@ee.ethz.ch). Check config.log to see what went wrong ...

...is 'configure' attempting numerous IEEE tests and failing the lot of them
then is forced to bail out.

> I'm a bit surprised at this, I thought the Atari GCC was fairly standard.

It is (for a 2.9x job). If it helps, think of headers as a "description of
your system". Most of them have nothing to do with "C" but describe your
compilation environment - your "system", stuff you've added and so forth.

> Being new to this I am not sure if it is just caused by some missing
> DEFINEs for Atari Mint specific stuff.

Me neither. I don't have MiNT. I might be able to dig out the cygwin-cross
if time for getting it working permits.

First off though, look in 'config.log'. The test results are stored there.
The rrdtool-1.2.1 C source for the test appears to be...

```
#include <stdio.h>
int main(void)
{
double nan,inf,c,zero;
/* some math to see if we get a floating point exception */
zero=sin(0.0); /* don't let the compiler optimize us away */
nan=0.0/zero; /* especially here */
inf=1.0/zero; /* and here. I want to know if it can do the magic */
/* at run time without sig fpe */
c = inf + nan;
c = inf / nan;
if (! isnan(nan)) {printf ("not isnan(NaN) ... "); return 1;}
if (nan == nan) {printf ("nan == nan ... "); return 1;}
if (! isinf(inf)) {printf ("not isinf(oo) ... "); return 1;}
if (! isinf(-inf)) {printf ("not isinf(-oo) ... "); return 1;}
if (! inf > 0) {printf ("not inf > 0 ... "); return 1;}
if (! -inf < 0) {printf ("not -inf < 0 ... "); return 1;}
return 0;
}
```

...there's more (preprocessor stuff I've snipped) but if you can persuade your gcc to compile the above (by adding options and/or headers) it ought to be possible to figure out a patch that'll get it past that point. I'm assuming here that MiNT can do (or emulate IEEE) though. Note that when 'configure' generates the above source and compiles it, it requires zero return (0=EXIT_SUCCESS=/bin/true) from the executable. Check 'config.log' first. It may have the answer.

Some headers you might care to see if MiNT has or ought to have:
math.h
float.h
ieeefp.h
fp_class.h

There are some messages that look like errors but I am not sure. However,
this looks more relevant:
```

```
configure:22103: result: yes
configure:22178: checking if IEEE math works out of the box
configure:22259: gcc -o conftest -g -O2 -DPIC conftest.c >&5
u:\tmp/ccfrEpzS.o: In function `main':
/usr/src/rrdtool-1.2.0/conftest.c:117: undefined reference to `sin'
collect2: ld returned 1 exit status
configure:22262: $? = 1
configure: program exited with status 1
configure: failed program was:
| /* confdefs.h. */
|
| #define PACKAGE_NAME "rrdtool"
```

>Some headers you might care to see if MiNT has or ought to have:
>math.h
>float.h
>ieeefp.h
>fp_class.h

I can find:

math.h in /usr/include
float.h in /usr/lib/gcc-lib/m68k-atari-mint/2.95.3/include

I can't find any trace of the other two. A search of the Sparemint
packages with Google didn't locate them either, yet.

Rejoining the Mintlist may be useful.

Regards,

Peter

> |
> | #define PACKAGE_NAME "rrdtool"

Yes, that looks worthwhile following up. Check where MiNT keeps its "sin"
symbol - prime candidate is libm.a so using my debian system as an
example...

```
$ nm -A --defined-only /usr/lib/libm.a 2>/dev/null |grep " sin"
/usr/lib/libm.a:e_lgamma_r.o:00000000 t sin_pi
/usr/lib/libm.a:s_sin.o:00000000 W sin
/usr/lib/libm.a:w_sinh.o:00000000 W sinh
/usr/lib/libm.a:s_sincos.o:00000000 W sincos
/usr/lib/libm.a:e_lgammaf_r.o:00000000 t sin_pif
/usr/lib/libm.a:s_sinf.o:00000000 W sinf
/usr/lib/libm.a:w_sinhf.o:00000000 W sinhf
/usr/lib/libm.a:s_sincosf.o:00000000 W sincosf
/usr/lib/libm.a:e_lgammal_r.o:00000000 t sin_pi
/usr/lib/libm.a:s_sinl.o:00000000 W sinl
/usr/lib/libm.a:w_sinhl.o:00000000 W sinhl
/usr/lib/libm.a:s_sincosl.o:00000000 W sincosl
```

...which, if I'm not too rusty on these things, means my system has a weak
(W) 'sin' symbol of no size. This is to be expected here as linux tends to
use glibc which has libm built into glibc so my 'sin' is just a stub. Off
the top of my head I expect you'll see Text segment (T) and non-zero code
size for 'sin' in your libm object archive. The 'nm' manual goes into
detail.

If desperate you can do the above on all your libs...

```
$ nm -A --defined-only `find /usr -type f -name '*.a'` 2>/dev/null |grep "
sin"
```

...note the difference between the backquotes and singlequotes there. Expect
it to take a while. I'm assuming MiNT doesn't have shared libs - it didn't
used to, so all you're looking for is "lib*.a" files.

In essence, hope the script has omitted "-lm" to the linker (corresponds to libm.a) in which case try passing it in the environment...

```
$ LDFLAGS="-lm" ./configure [whatever]
```

...and 'configure' should pick it up. Note that other variables can be altered in same manner. Here's a few common ones...

```
CPP preprocessor
CC C compiler
CXX C++ compiler
LDFLAGS linker flags
CFLAGS C compiler flags
CXXFLAGS C++ compiler flags
CPPFLAGS preprocessor flags
```

For sillyness...

```
CC="/bin/ook" ./configure
```

...you'll see that 'configure' will fail because the C compiler "ook" is broken - because it doesn't exist! ;-) On the other hand it is a hint on one way to proceed with stubbon builds: bodge yourself a pseudo compiler...

```
<my-gcc>
#!/bin/sh
gcc "$@" -lm
</my-gcc>
```

```
CC=`pwd`/my-gcc ./configure
```

...thus if you were to encounter a bug in 'configure' that erroneously stripped "-lm" you could bodge yourself past it by telling 'configure' to use "my-gcc" then tag that option onto the call to the real gcc. Definately into hacking territory here so I'll stop waffling.

```
>>Some headers you might care to see if MiNT has or ought to have:
>>math.h
>>float.h

```

See what headers math.h itself pulls in.

```
> I can't find any trace of the other two. A search of the Sparemint
> packages with Google didn't locate them either, yet.
```

If arrangement is same as unix...

```
$ grep -rl "sin" /usr/include/*
```

...chances are the file will reside within */include/bits/* or
/include/sys/ folders. Mine aren't any help here as the PC has a few
possible headers it can use depending on compilation options.

> Rejoining the Mintlist may be useful.

Can't do any harm. :-)

This is correct, however this will do software maths. An easier way would be to do CFLAGS="-m68881" which will compile your app with hardware fpu support. These functions will then use the hardware fpu instead of software emulation libraries. Should result in a dramatic speedup.
Enjoy.

START MAKING MONEY TODAY !!!!!!!!!! COOOOOOOOOOL !!!!!!!!!!
1. Make 800,000$ in 3months!! EASY!!!
Dear Friends: Greetings: I am a retired attorney. A few years ago a man came to me with a letter. He asked me to verify the fact that this was legal to do. I told him I would review it and get back to him. When I first read the letter my client brought me, I thought it was some "off-the-wall" idea to make money. A week and a half later we met in my office to discuss the issue. I told him the letter he originally brought me was not 100% legal. My client then asked me to alter it to make it perfectly legal. I asked him to make one small change in the letter. I was still curious about the letter, so he explained to me how it works. I thought it seemed like a long shot, so I decided against participating. But before my client left, I asked him to keep me updated on his results. About two months later, he called me to tell me he had received over $800,000 in cash. I didn't believe him, so he asked me to try this idea and find out for myself. I thought about it for a couple of days and decided I really didn't have anything to lose, so I asked him for a copy of the letters. I followed the instructions exactly, mailed 200 copies, and sure enough, the money started coming in! It arrived slowly at first, but coming. I kept a precise record of the earnings, and in the end, it totaled $978,493! I could hardly believe it. I met with my friend for lunch to find out exactly how it worked. He told me there are quite a few similar letters around, but this one is different because there are six names at the end of the letter, not five like some others. This fact alone results in your name being in far more returns. The other fact was the help I gave him, making sure the whole thing was legal, since no one wants to take the risk of doing something illegal.
: By now you are surely curious to know what small changes to make. If you sent a letter like this one out, in order to be completely legal, you must actually sell something in order to receive a dollar in return. So when you send a dollar to each of the names on the list, you must include these words, "PLEASE PUT ME ON YOUR MAILING LIST" and include your name and address. This is the key to the program. The item you will receive for the dollar you sent to the six people below is the letter.
: At the time I first tried this idea, I was earning a good living as a lawyer. But everyone in the legal profession will tell you there is a lot of stress that comes with the job. I told myself if things worked out, I would retired from my practice and play golf. I decided to try the letter again, but this time I sent 500 copies. Three months later , I had totaled $2,341,178!
: Here are a few reasons a person might give for not trying this program: ï¿½ Some people think they can never make a lot of money with

anything this simple. ï¿½ Some are afraid they will be ridiculed for trying ï¿½ Some dream of large sums of money, but do nothing to actually achieve it. ï¿½ Some are just plain lazy. ï¿½ Some are afraid of losing their investment. They think this program is designed to beat them out of a few dollars.
: The system works if you will just try it. But you must follow the simple instructions exactly, and in less than three months, you will receive $800,000 GUARANTEED! Keep what you are doing to yourself for awhile. Many will tell you it won`t work and will try to talk you out of your dreams. Let them know of your success after it works.
: LETTERS FROM PARTICIPANTS IN THIS PROGRAM:
: My name is David Rhodes. In 1992 my car was repossessed and bill collectors were housing my. I was laid off and my unemployment ran out. In October of 1992, I received a letter telling me how to earn $800,000 anytime I wanted. Of course, I was skeptical. But because I was so desperate and virtually had nothing to lose, I gave it a try. In January 1993, my family and I went on a 10-day cruise. The next month I bought a brand new Mercedes with cash! I am currently building a home in Virginia and I will never have to work again. This money program really works perfectly every time. I have never failed to receive less than $500,000. This is a legitimate, money-making opportunity. It does not require you to sell anything or to come in contact with people. And , best of all, you only leave the house to mail the letters. If you have always believed that someday you would get the lucky break, then simply follow the instructions and make dreams come true.
: Larry McMahon, Norfolk, VA Six months ago, I received this letter and ignored it. Five more came within a period of time and I ignored them also. I was tempted, but I was convinced that they were just a Hoax. After three weeks of deliberating, I decided to give it a try (not expecting much). Two weeks went by and nothing happened. The fourth week was unbelievable! I cant say I received $800,000 but I received $400,000. For the first time in years, I am debt free. I am doing this again, only this time starting with 500 post. I strongly recommend that you follow the instructions exactly as outlined in this letter.
: INSTRUCTIONS
1. Immediately send $1.00 to each of the six people on the list at the end of this letter. Wrap the dollar bill in a note saying " Please add me to your mailing list" and include your name and address.
: 2. Copy this letter. You do not have to type it 200 times. Simply place your cursor at the top of the page, hold it and drag it all the way down to the end of the letter. Then click on "edit" and select "copy". Now open up a notepad file on your computer and put the cursor at the top of the page in the notepad, click on 'edit' and then select 'paste' it will copy the letter for you onto your computer.
: 3. Remove the name next to the #1 on the list and move the rest of the names up one position (#2 becomes #1, #3 becomes #2, etc.....) Then place your name in the #6 position. Then save it, make sure it is saved as a txt. file.
: 4. When you have completed the instructions, take this letter and then go to (Google,Yahoo,...) and type in (Making Money Massege

board,or post massege,...)and start posting your copy to 200 message boards,or more this is only the minimum, you can post as much as you like...The more copies you send the better the results. Keep a copy of this letter so you can use it a second time. Post it out again in six months, but Post it with the addresses you receive with each dollar. It will work better the second time. NOTE: This service is 100% legal - (Refer to title 18 section 1302 of the U.S. Postal & lottery laws) : How does it work? When you send out 200 Posts, it is estimated that at least 15 people will respond and send you a $1.00. ($15.00) Those 15 will Post 200 Posts each and 225 people send you $1.00 ($225.00) Those 225 people Post 200 Posts each and 3,375 people send you $1.00 ($3,375.00) Those 3,375 post 200 posts each and 759,375 people send you $1.00 ($759,375.00) At this point your name drops off the list, but so far you have received $813,615.00. P.S. When your money begins to come in, give the first 10% to charity with spirit and share a good fortune! : important tip - Cover money by paper fully by which it can not been seen in light , because postal employees do some cheat some times....ok

Here are details for the annual swapmeet to be held next month by
the Columbus Atari club:

DATE: Saturday, September 10, 2005.
TIMES: 9 am to 3 pm.
ADMISSION: $4. (For vendors, including table: $6.)
PLACE: Oakland Park Community Building, 980 Lenore Avenue,
Columbus, Ohio.
MORE INFO AT: http://www.angelfire.com/oh4/acec/acec.html
CONTACT: R. Wayne Arenz (rarenz at columbus dot rr dot com)

I'm off but it's a long drive. Exactly how big of an event is this? I'm
not going to come if it'll be quite small. I would consider going just to
meet lp, Carey Christenson and you Edward ;)

Thanks,
Mark

ob_spec is a union type, which cannot be converted to pointer type by gcc.

Replace the definition of ErrMsg by the following:
#define ErrMsg(a) em[a].ob_spec.free_string

HTH,
Arnaud.

Hi, Peter!

PS> but I suspect this is part of the problem:
PS>
PS> #define ErrMsg(a) (char *)em[a].ob_spec

You are right. The error refers to the casting operator "(char *)".

PS> Pointers in C really DO my head-in. What am I missing ?

It was good to know the structure typedef for the "em" structure, I only
can guess that obj_spec must be some kind of string(-pointer?).

So 1) assumed that ob_spec is a char[LENGTH] (a string). The casting
operator then is wrong. You want char -> address(char), therefore "&" must be
used.

2) Assumed that ob_spec is a (char *) to a string located somewhere
else. The casting operator then is superfluous: ob_spec already is a pointer. This
situation may be handled
differently by different compilers (from error to being ignored).

BTW: for accessing the content of the address pointed to c, the "&"
operator could be used.

Regards,

Alexander

I have been continuing my experiments in trying to compile Newsie 0.961 with gcc

So far I have eliminated some forward declaration problems by moving a few functions. Now I have another problem. There are lots of lines like this:

```
sprintf( command, ErrMsg(EM_ConnectTo), prefs.news_server );
```

they all give the same error:

```
newsie.c:1976: cannot convert to a pointer type
```

The EM_ConnectTo are all defined in newsie.h as follows:

```
#define EM_ConnectTo 46 /* G_STRING in (#23) Error_Message */
```

I am no C expert, that much is clear, but I suspect this is part of the problem:

```
#define ErrMsg(a) (char *)em[a].ob_spec
```

Pointers in C really DO my head-in. What am I missing ?

Peter

Hi, Peter!

Small correction:

AB> BTW: for accessing the content of the address pointed to c, the "&"
AB> operator could be used.

Of course it's not the "&" operator, but the "*" operator that gives
access to the variable that is pointed to.

Regards,

Alexander

Thanks. That has worked perfectly. I had looked-up some stuff on EM_ConectTo
but hadn't looked for ob_spec because I didn't realise it was AES.

I am now going to investigate the "incompatible pointer type" errors in calls
to `mt_graf_mkstate', `mt_wind_get, `mt_fsel_exinput' and `vst_point'.

They may well be caused by similar problems. I need to find some good docs on
the AES.

Peter

Thanks to Arnaud's website I have fixed most of these. They where caused by local
variables declared as int when they should have been short. Differences in libs ?

vst_point calls are still giving these errors:

newsie.c:1870: warning: passing arg 3 of `vst_point' from incompatible pointer type
newsie.c:1870: warning: passing arg 4 of `vst_point' from incompatible pointer type
newsie.c:1870: warning: passing arg 5 of `vst_point' from incompatible pointer type
newsie.c:1870: warning: passing arg 6 of `vst_point' from incompatible pointer type

from lines like this:
vst_point(handle, rc, &charw, &charh, &cellw, &cellh);

The char and cell vars are not local and I can't see where they are declared.
Are they in the libs ?

There are a few other probs that I am looking into.

Peter

They are declared in NEWSIE/GLOBAL.H

I found them within a few seconds by using my editor (see my homepage)

You're lucky that I once downloaded newsie sources out of curiosity ;-)

Newsie should compile with Pure C.
If you try Pure C first, you can use the Pure C shell for finding
non local declarations. You must use the GEM integrated version of
Pure C and activate project database.
After compiling, put the cursor on charw and press HELP.

Use the Pure C project as a reference guide for the gcc transition
precess. The Pure C editor can also look for a name in all the files
of the project or a folder. Pure C provides you with a list of all
occurrences of the name in the message window. A simple click on the
line opens the file and selects the occurence.

The last opportunity also exist in my editor (see sig).

And of course, if you dont like these powerfull features,
there is grep I suppose.

I think it is quite possible to answer such questions yourself
if you are willing to use the available tools.

Dont expect us to do that for you.

I don't own PureC and I don't think I have ever seen a copy for sale over here.

Besides, the whole point of my little exercise was to try to learn a little about GCC and the development environment while also trying to get Newsie to compile with GCC. I was just documenting my experiences. Atari development has always seemed difficult to get into because people don't seem to share their experiences very much. I'm a software developer too.

I did spend a while searching for charw etc. but found nothing then as soon as I sent the last message I found them, typical. ;-)

I have often said how much I hate command line tools with dozens of arguments which is why I use Suji instead of grep. Even if I did learn how to use grep I would forget within a week. It's just the way my brain works.

Anyway, some progress has been made and I am now hunting down the last few items.

Regards,

Peter

However, if I am missing some vital lib then no amount of grep is going
to help. Plus searching the whole u:\ partition to check all the possible
lib locations does take quite a lot of time.

Peter

I dont know Suji, so I dont know if it is better than my AHCX.
I would be pleased if you gave it a try. It also has very usefull
single right click selection option.
Very usefull for matching nested braces, including #if... #endif

I dont think it is very likely that libraries contain
globally accessible variables.

In a perfect world the only globally accessible names in
libraries should be those of functions.

5827. [annc] DIS6502 1.6 released

Newsgroup: comp.sys.atari.programmer
Date: 2005-08-17 03:31:19 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns96B4E4C2EB165emuslor@216.196.97.136>
Source record: 246

My apologies if this appears twice. The first attempt does not appear to have made it through...

Version 1.6 of Eric Bacher's interactive 6502 disassembler has been released. This release is a port to Win32 with a few bug fixes and a number of new features. You can now find the latest version at its new home:

http://sourceforge.net/projects/dis6502/

We hope those of you who remember DIS6502 from back in the 16-bit Windows days will grab this new one and give it a run. Make sure you take a look at changes.txt for release notes, and please enter any bug reports or feature requests in the project tracker on SourceForge.

Thanks!

dos.h seems to be a LatticeC library so I am now thinking of replacing
the calls too dfind with something else.

Presumably there is a Mint/GCC friendly alternative to the stuff provided
by dos.h

Can the same thing be done with readdir ?

Any chance this could get ported to a non-proprietary and still
available AWK or Perl implementation?

What obstacles do you see in such a port?

> What obstacles do you see in such a port?

If the question is "Can an assembler be written in another dialect of AWK?" the answer is yes. "The AWK Programming Language" by the original AWK creators includes a simple assembler as one of its examples (a very clear example, too!). "Amazing AWK Assembler" by Henry Spencer is still floating around out there, although it is sometimes cited as an example of how *not* to do things (I've looked at it but can't really understand it).

If the question is "Can HXA be ported to another version of AWK?" the answer is...maybe. Probably not directly. TAWK has a number of very useful extensions that simply don't exist in versions such as gAWK. Among them:

1) TAWK is compiled, not interpreted (very quickly, I might add). Not in itself a deal-breaker, but any other version would likely run much more slowly.

2) TAWK's user-defined functions are much closer to the way functions work in most major languages. The kludge used for "local" variables in most AWKs (ie., defining extra arguments in the parameter list and then not initializing them when calling the function) is completely unnecessary in TAWK. I suppose most functions could be re-written in this style, perhaps along with a few global variables used exclusively for loop indices and such.

3) TAWK has true multi-dimensional arrays, rather than the concatenated indices "kludge" of other AWKs. This is tougher to get around, as HXA uses multi-dimensional arrays quite often and nearly as often is interested in the value of the second or later index independently of the previous indices. A port might be better of trying to implement "equivlant functionality" rather than attempting to duplicate the TAWK functionality directly.

4) TAWK array indices are by default sorted in increasing order (a property this version of HXA relies on even more heavily than previous versions), while other AWKs make no order guarantee (the current maintainer of gAWK has been known to wonder how Pat Thompson did it). Many times when HXA uses this property to visit array elements in order the indices are numeric, and so these could often be changed to FOR loops. But sometimes even if they are numeric there are large gaps (on the order of 2^20 or more) between

consecutive index values, so it could take a while for this kind of loop to complete.

In sum, to port to another version of AWK it might be easiest to try to figure out what the purpose of anything HXA does is, and if it uses some special feature of TAWK to accomplish it, try to figure out how to provide equivalent functionality in that version of AWK.

Me, when I think about porting to a different language I usually consider what I could do with C and a good regular expression library :). I'd also probably make a lot of use of structures, which don't exist in TAWK (I fake them sometimes with those multi-dimensional arrays).
I'd very much miss the automatic memory management of all the AWK variants, though.

I probably wouldn't make a lot of changes to the overall design of HXA. I'd do the "equivalent functionality" thing.
With any luck it's modularized heavily enough that that shouldn't be too exceeding difficult (just match the function inputs and outputs and internally do whatever).

- Anton Treuenfels

Can't say that I have. I don't know much about Python or Perl or Ruby. When I came across an old (really old) version of gAWK I thought "Here is something I could really use! - if it wasn't so broken!".

When I found TAWK I thought "This has everything I thought was missing!". So now if the problem looks like a text file the solution looks like TAWK to me :) Well worth every penny I paid for it - I just wish I'd upgraded when I had the chance.

But let's not get ahead of ourselves. I don't have any immediate plans myself to convert HXA to another language. If anyone wants to do that themselves, well, the sources are there and it's GPL'd - have at it!.

If someone is just interested in adding a new processor and is willing to write the single replacement module that would be needed (plus the necessary test files showing that it handles correct/incorrect input and the documentation, of course), I'd be willing to compile it and add it to the download.

- Anton Treuenfels

5835. [ANNC] Dis6502 1.7 released

Newsgroup: comp.sys.atari.programmer
Date: 2005-08-28 19:13:55 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns96C090C871F96emuslor@216.196.97.136>
Source record: 154

```
Lots of enhancements for this one - download at:

http://sourceforge.net/project/showfiles.php?group_id=145747

Version 1.7
-----------
Thanks to Steven J. Tucker for giving us many ideas.

New features:
- The dump popup menu has an option to guess byte type. This option
tries to follow the flow of the program beginning with the byte
selected by the user. All data in the flow of the program is
marked as code.
- There are two other options in the dump popup menu to select next
block of unknown type and to change the remaining data to bytes.
- An option has been added to display Zero-Page instructions with
absolute addressing mode as bytes. These instructions use 3 bytes
instead of 2.
- The disassembly now centers the selected line and displays it with
a yellow background.
- Disassembly window has a popup menu which offers options like find,
find next, select definition of a label, select all references of
a label and rename a code label (Lxxxx).
- Double click on a line in the disassembly window jumps to the
definition of the label found in the instruction.
- The disassembly popup menu has an option to return to the previous
position after a jump to a definition or to a reference.
- Mouse wheel is now supported and scrolls the window under the mouse
cursor.
- The File menu now supports ROM file loading and raw file loading.
Only ROM with no bankswitching are loaded.
- 2 sub-menus have been added in the File menu to open recent files
and recent workspaces.
- User labels can be exported in xasm format to be loaded in
Atari800Win emulator.
- System labels can now be unloaded from the Label menu.

Fixed bugs:
- Opcode $B6 produced a bad disassembly.
- When $00 address was referenced, an L0000 was used but not defined
in the disassmebly listing. This label is not used anymore.
- 5200 files are loaded through the 'load ROM file' instead of the
'load binary file'.
- Some Oric files could not load properly because the header of the
last segment did not match the size of the file. This is not any
```

more considered as an error.
- Dialog box for loading sectors from a .ATR is now working fine.

I can't display JPEG images with Papyrus and CT60 in 060 mode.
I tried the demo versions and my latest version (PAP X), and it's exactly
the same: instruction error everytime a JPEG appears.

Everything works in 030 mode.

I tried clean booting, and it's the same.

Any hints?

Thanks in advance

Paolo

I sometimes get errors when I boot up Papyrus X on my Hades 060. The thing
that works for me is either boot the computer under regular TOS or else boot
it in the 256 color mode. I usually run things in the 24-bit mode.

UPDATE:
I installed easyMiNT, actually I rushed an installation, but it went well.
At the first shot I had a working environment (with some glitches, 16
colours, 640x480, and my auto PRGs didn't load) but Papyrus loaded JPGs
immediately.

So, I assume, it is something connected with the TOS itself, or at least,
the TOS routines that are replaced by MiNT...
Now I'll dig into MiNT to see if it can accomodate my needs, so I'll forgot
plain TOS problems.

who knows...

In the meanwhile, thank you guys!

5840. Announcement: cc65 version 2.11.0

Newsgroup: comp.sys.atari.programmer
Date: 2005-09-10 15:17:07 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <dfutdjpof1@moppi.musoftware.de>
Source record: 159
Cross-posted to: comp.sys.cbm,comp.sys.oric,comp.sys.atari.programmer,comp.sys.apple2.programmer

I'm proud to announce cc65 version 2.11.0. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- The Commodore VIC20 (contributed by Steve Schmidtke <steve_schmidtke@hotmail.com>).

- The Commodore C64 and C128.

- The Commodore C16, C116 and Plus/4.

- The CBM 510 (aka P500), a quite rare Commodore machine (programs run in bank 0).

- The CBM 600/700 family (programs run in bank 1).

- Newer PET machines (not 2001)

- The Apple][and successors (basic support by Kevin Ruland <kevin@rodin.wustl.edu> and many, many additions by Oliver Schmidt, <ol.sc@web.de>).

- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler <cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga <taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).

- GEOS for the C64 and C128 (by Maciej Witkowiak <ytm@elysium.pl>)

- The Nintendo Entertainment System (NES) (contributed by Groepaz, <groepaz@gmx.net>).

- The Supervision console (contributed by Peter Trauner, <peter.trauner@utanet.at>) (startup code and linker config only).

- The Oric Atmos (this one is - still - BETA!).

- The Lynx Console. Support was added by Karri Kaksonen <karri@sipo.fi> based on the original Lynx compiler by Bastian Schick. Bastians code was used with permission - thanks!

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

Changes to the last version:

This is quite a large step from the last version. See the (probably incomplete) list of changes below for more information.

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Enterprise Linux 3. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper, the docs, and the target specific libraries. To develop for one of the predefined target systems you need the compiler RPM package *and* one of the target machine packages. Be sure to download the documentation package if you're not already a cc65 user.

Binaries for DOS and and Windows should also be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages, plus optionally the doc package.

New in the windows version is the beta version of a poor mans windows installer: Grab all the windows packages you need and unpack them into one tree. Then double click on the "install.vbs" file. This will install the tools in the program directory, will add start menu entries for the docs, setup the necessary environment variables, and add an uninstaller as well. IF YOU HAVE ANY PROBLEMS SETTING UP CC65, IT IS STRONGLY ADVISED THAT YOU GIVE THE INSTALLER A TRY!

Download:

For more information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Mailing list:

There is a mailing list for discussing cc65 related issues (programming, suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

Many people have contributed to this version, please be sure to have a look at the CREDITS file. Thanks to all contributors!

Have fun!

Uz

[Incomplete list of changes against version 2.10]

* Assembler:

- New feature missing_char_term.

- New feature ubiquitous_idents.

- Optional curly braces allowed as delimiters for token lists.
Incompatible change: Brace matching in some cases is gone.

- New 6502X cpu that includes 6502 illegal opcodes.

- Better error messages in case of a range error.

- Assembler defines target system symbols (__C64__ etc.) similar to the
C compiler.

- Handle foreign newline sequences (cr/lf under Unix) more gracefully.

- Fixed problems with unnamed labels.

- The assembler does now support the SWEET16 16 bit pseudo CPU.

- Support for zilog/intel style hex numbers (trailing 'h').

- New .ident and .sprintf pseudo functions.

- Variable symbols using .set.

- Support for a "none" CPU that has no opcode mnemonics at all. People
use ca65 to implement instruction sets for other CPUs using macros,
and this pseudo CPU should remove any conflicts.

- Support for the HuC6280 CPU used in the PC engine.

* Compiler:

- Rewrite of input and preprocessor routines. Among other things, this
adds C99 style variadic macros and removes the input line limit.

- Stackable pragmas using #pragma(push, val) and #pragma(pop)

- New pragmas codesize, optimize, regvars, and warn (all stackable)

- New option --writable-strings

- Rewrote part of the parser allowing better code generation in a few
places.

- The "inline standard functions" option (-Os) has slightly changed its
meaning: In older versions it controlled inlining. Now, the compiler
will always inline if it considers it safe to do so, and the flag does
only control inlining in situations where inlining is not always
completely safe.

- More and better inlining of known standard functions. The following
functions may get inlined: strcpy, strlen, memcpy, memset.

- Inline assembly can now reference C labels with the %g format specifier.

- The -A and --ansi switches are gone, together with the __STRICT_ANSI__ predefined macro. Instead there is now a command line option --standard that allows to set c89, c99 or cc65 as language standard. The compiler defines a macro __CC65_STD__ that is one of __CC65_STD_C89__, __CC65_STD_C99__ or __CC65_STD_CC65__ depending on the command line option. Default is cc65 (all extensions) as before.

- Improved code for shifts.

* Linker

- Start Oric programs at $500 (Stefan Haubenthal)

- Added library groups.

- Simple expressions now supported in the config files.

* cl65 utility:

- Extended to support additional command line switches of the underlying tools as needed.

- New -Wa and -Wl switches to pass options to the assembler and linker.

* Disassembler

- New "asminc" directive that allows to read in a file containing assembler symbol assignments in the form "name = value".

- New "comment" attribute for several directives.

* Library

- Mouse support uses loadable drivers.

- Changed command line argument syntax for C64.

- Command line parameters are now working for: C64, C128, Plus/4, C16, VIC20.

- ungetc is available. Read functions on streams support pushed back characters.

- New apple2enh target by Oliver Schmidt.

- Lots of Apple2 improvements by Oliver Schmidt.

- Oric TGI driver by Stefan Haubenthal.

- New _heapblocksize function that returns the size of an allocated block.

- New lynx target by Karri Kaksonen and Shawn Jefferson based on Bastian Schicks cc65 port (thanks!).

- Joystick and TGI drivers do now have an interrupt entry. The API version has been changed which means that old drivers will need an update.

- Full set of scanf functions available (base work by me, lots of
improvements by Greg King).

- scanf functions for conio (Greg King).

- New function posix_memalign.

- Directory routines for the Apple machines (by Oliver Schmidt).

- SSC serial driver for the apple2 and apple2enh targets (Oliver Schmidt).

* Documentation

- Lots of additions to the function reference.

- Several target specific docs (one prominent contributor was Stefan
Haubenthal).

* Other

- Poor mans windows installer.

- The output of --help goes to stdout instead of stderr.

Thanks! I have to admit that there have been rather calm periods (the release of the last major version was christmas 2003). While the work may look continuous from the outside, it was not. But it's only the result that counts:-) Fortunately, there are a few regular and many more not so regular contributors (especially for the platform stuff), so progress happens in some areas even without me.

Regards

Uz

Well I am making slow progress. I created a replacement for dfind by
writing a function using dirent.h

A quick change of _AESGLOBAL to aes_global and the compiler errors
were done but I now have a bucket load of errors from ld.

I don't think I am using gcc properly. I am just doing gcc newsie.c
and it probably needs more parameters.

Here is a sample of the errors:

u:\tmp/ccNLjgwN.o(.text+0x78b6): undefined reference to `CAB_internet_mail_client'
u:\tmp/ccNLjgwN.o(.text+0x78d6): undefined reference to `init_stik'

You have to add gemlib (recent version 0.43.x) => -lgem in gcc command line

> u:\tmp/ccNLjgwN.o(.text+0x7a18): undefined reference to `gl_apid'

I don't know for this one.

gemlib no more have gl_apid. Use the macro _AESapid instead (defined in
gem.h)

HTH,
Arnaud.

Hi,
Does anyone know the proper syntax or settings for Devpac 3.10 to assemble 68851 instructions?
In the Assembler options I have the box checked for 68851 and processor as 68030 but
pmove crp,(a0)
gives an error saying invalid size. It doesn't matter which 68851 register is the source it always
give the same error, but I know the instruction should work as I have seen it in other code.

Any help would be appreciated, thanks.

Nicholas Steele

You need to write a quadword. the crp is 64bit value.

use pmove.d crp,(a0) instead.

hello and greetings every body , iam new to
programming but have written new program to share.

this "program"assists users of both platforms (pc and atari)to easily
transfer data back and forth via the disk drives.

well if there are interested individuals out there who have tried other
programs similar and know what i'm taking about (the xp disk format bug).
feel free to email me your address and i can send , over the electric wire
,a copy of my program.
this is an atari st program and works primarily in the hi res setting.

short description: changes st disk format and creates a disk which will be
read by both disk drives from the atari computer.

charles.copp@sympatico.ca

Hello,

That is nice, but there are other programs for older ST that will format a disk so it can be read by both. The newer ST's have it built in the TOS so that formatting a disk will automatically be able to read by a read and vice versa.

yes but exucution of this program is under 10 seconds and leaves the contents of the disk readable after changes ....(not applicable to self booting disks,TRY AT OWN RISK).it does not format the disk , only leaves new "stamp" in the boot sector of the disk.

it different ,easy and quick, why fool around with a bunch of variables and settings when all we need is a regular atari formatted disk with an ibm compatible boot sector?

just something different really, you know like pennies or dimes ,they all amountr to something and hold different properties.

This is nothing new. You can find a similar program in the download section of my homepage (www.mbernstein.de) which i is much more than 10 years old. But after i upgraded to TOS 1.4 there was no need for it.

Regards
Michael

5854. AHCC progression report

Newsgroup: comp.sys.atari.programmer
Date: 2005-11-22 22:33:31 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <4463$43839cbc$1884f879$12844@news.chello.nl>
Source record: 173
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

LS

AHCC or ANSI HCC is Sozobon turned into a full C89 compiler
for Atari ST and all its offspring.

I have reached the stage where I was able to produce working
binaries of 2 of my own applications.

These are AHCX and a small spreadsheet program.

I will gradually increase the amount of working binaries
(for instance TT-Digger) and also use them myself.

Once all my own applications work stable I will ask for a small
amount of beta testers.

2 programs working may sound modest, but for me it means
that a very substantial amount of compiler code is actually
working correctly. :-)

It also means that the project starts to display a
shimmer of feasability.

The comprehensive version of AHCC will integrate
editor(AHCX), project manager, compiler, assembler and linker
in a single GEM program of about 350 Kb.

Freestanding components can be produced on request.

AHCC compiles Pure C sources without the need for changing
a single byte.

AHCC produces the Pure C object format which means that Pure C
and AHCC object files and libraries can freely be mixed.
(It made testing the compiler a lot easier :-)

In the future, usefull C99 features will gradually be implemented.

Wow! Congratulations! :D

> Once all my own applications work stable I will ask for a small
> amount of beta testers.

I am interested in beta-testing! However I only have a few personal C
sources ; I prefere assembler or higher level (read garbage-collecting)
language like Java.
But if there already is a minimal libc (or perhaps PCSTDLIB already
works ?), I may try it on a few command line utilities I would like to
port (GNU stow, patchutils, robodoc and things like that).

Also also getting the gemlib, zlib and some other key Pure-C librairies
to work could lead in cascade to some interesting builds like...
HighWire! ;)

> The comprehensive version of AHCC will integrate
> editor(AHCX), project manager, compiler, assembler and linker
> in a single GEM program of about 350 Kb.

That's in itself quite a achievement!
<whining>
However it's sad there is not source-level debugger (yet)! ;P
And I think my eyes and I cannot use a programming editor without
syntax highlighting any more!
</whining>

> Freestanding components can be produced on request.

That's really much appreciated: I think a separate assembler could be
put to good use if it support Motorola-syntax and 68020+ instructions,
as there is currently no more still-developped assembler expect GCC's
gas... But as it is intended to compile pre-processed C source code, I
guess there is no internal macro-language (INCLUDE, MACRO, REPT and the
like), "just" cpp?

> AHCC produces the Pure C object format which means that Pure C
> and AHCC object files and libraries can freely be mixed.
> (It made testing the compiler a lot easier :-)

It's also nice of you to be modest enough not to invent your own
format!

Once again congratulations for your work and tenacity,
Guillaume

P.S.: And once more if you have written/found a doc on the Pure-C
object format, feel free to share it! ;)

Hi Andy!

> Is Line-A considered part of the VDI?

The ROM-VDI is based on the Line-A routines. So Line-A is the low level
part of the original VDI screen driver. All output on the screen is done
via LineA.

So one might say that it is part of the VDI. But only of the original VDI.

However the OS design clearly speaks against the direct use of LineA.
What if there is another VDI that doesn't use Line-A for its screen driver?

NVDI surely doesn't use LineA, it uses its own drawing routines (Thats
why it is so much faster). So in the case of NVDI LineA is not a part of
the VDI.

Any objections to this point of view?

Why did you ask?

Cheers, Ingo =;->

:
> Why did you ask?

I'm just trying to piece together in my head the various
lumps of the operating system and their interaction. Does
the original AES work exclusively via VDI?

Thanks,
- Andy Ball

```
Hi Andy!

> Does the original AES work exclusively via VDI?

Exclusively via VDI and GEMDOS.

OS part - uses
----------------
GEM - AES, VDI
AES - VDI, GEMDOS
VDI - BIOS, XBIOS, GEMDOS, LineA
and direct hardware access in drivers

Cheers, Ingo =;->
```

> and direct hardware access in drivers

I can see AES using GEMDOS for things like file selectors,
but I'm surprised VDI uses BIOS and GEMDOS. I thought that
AES & VDI were parts of GEM. Does GEM above just refer to
the desktop, or are there other lumps that I am missing?

GDOS apparently didn't ship with the earlier versions of TOS
(not sure about later versions). Where present, is it
conceptually part of the AES?

Thanks,
- Andy Ball

hey group , i'm new to this programming thing but this is what i found
within gfa basic states that "line-A-calls"
are independant of vdi insrtuctions.
also:
and colors given in the line_a_routine correspond to the hardware color
registier ie:.....setcolor(1).
and not the number that vdi uses(color).

well just helping..
charles

Hi Andy!

> but I'm surprised VDI uses BIOS and GEMDOS.

Why? Not that I know the source or internals of the VDI, but it might
use Kbhsift (BIOS(11)) and what if VDI wants to load fonts? Needs to use
some gemdos functions, wouldn't it?

> Does GEM above just refer to the desktop, or are there other lumps
> that I am missing?

I would say it is more than the desktop.
GEM = Graphics Environment Manager

So I would say GEM is everything that brings you a graphical environment
on your computer and that is more than the desktop.
As I said above, GEM = AES + VDI and yes, you might count the desktop in
here, too :-)

> GDOS apparently didn't ship with the earlier versions of TOS
> (not sure about later versions).

I also dont know. One thing is sure though:
It was never built into ROM, even though actually it should have, but
there was simply no space left in the ROM chip.

In one way that was a blessing, because lots of improvements were made.
The bad thing was, it wasnt really standard and lots of programmes jsut
didnt use it and everyone invented the wheel again.

> Where present, is it conceptually part of the AES?

Not at all! It is part of the VDI! If you take away all the device
drivers of VDI, then what remains is GDOS.
GDOS = Graphics Device Operating System

It is a pity that the "Profibuch" was never translated. It is THE source
regarding ATARI, IMHO. Thats where I have all my info from. This book is
almost never wrong.

Cheers, Ingo =;->

Hi Charles!

> states that "line-A-calls" are independant of vdi insrtuctions.

Yes, of course they are! VDI is based on them, so Line-A cant be based on VDI.

But this is also the reason, why Line-A should never ever be used in a clean GEM application. Such an app should only use VDI, AES and GEMDOS calls. Only if it really has to, (X)BIOS.

Line-A is really low-level. Besides it only really works on original Ataris and then also not in resolutions with lots of colors, AFAIK.

So if you are about to write clean applications, avoid ALL Line-A functions. If you code in GFABASIC, check out those two pages:

GEM GFA Editor (GBE) and lots more:
http://www.bright.net/~gfabasic/

Runonly Interpreter for GBE (and a few other nice tools):
http://www.run-software.de

The runonly is my work, by the way :-)

Cheers, Ingo =;->

ASB> Does GEM above just refer to the desktop, or are
> there other lumps that I am missing?

IS> I would say it is more than the desktop.
> GEM = Graphics Environment Manager

I know what GEM is, I was just confused by your notation above: GEM (no part specified) calls AES and VDI, which are parts of ...erm, GEM.

IS> Not at all! It is part of the VDI! If you take away
> all the device drivers of VDI, then what remains is
> GDOS. GDOS = Graphics Device Operating System

Thanks, I had not realised that VDI included anything that high-level, which is also why I would not have guessed that it called upon GEMDOS.

Money Making Try It Works!
HELLO, I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of 6.00! So I thought, Yeah right, this must be a scam, but like most of us, I was curious, so I kept reading. Anyway, it said that you send 1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at...6, and post the article in at least 200 newsgroups (There are thousands). No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: what have I got to lose except 6 stamps and 6.00, right? Then I invested the measly 6.00. Well GUESS WHAT!! Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about 25.00. By the end of the second week I had made a total of over 1, 000.00! In the third week I had over 10, 000.00 and it\'s still growing. This is now my fourth week and I have made a total of just over 42, 000.00 and it\'s still coming in rapidly. It\'s certainly worth 6.00, and 6 stamps. I was in a bad economic state before I found this article... I didn\'t believe this really worked until I ACTUALLY started getting mail from all over the world... I bought everything I needed... This idea came in the right time exactly :-) Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money comes in! It\'s easy. It\'s legal. And, your investment is only 6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really Works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and 50, 000 or more can be yours in 20 to 60 days. This program remains successful because of the HONESTY AND INTEGRITY of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it\'s a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces of paper and write the following on each Piece of paper; PLEASE PUT ME ON YOUR MAILING LIST. Along with your name and address. Now get 6 US 1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a 1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

1) Arik Stephens r.r.2 box 251e St. Elmo, IL 62458

2) Scott Miller 9537 Leyendekker ct. Lakeside CA 92040

4) Tyler Otto 271 Weston Cir apt 21 Vista, CA 92083

4) Rashantees, PO Box 708, El Cerrito, CA 94530

5) Magus c/o Bob Condor 1242 South Portage Rd, RR2 Haliburton . Ont. Canada K0M1S0

6) Jonathan Burnett, 842 E. Co. Rd 60, Mendon, IL. 62351

STEP 2: Now take the first name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR NAME as number 6 on the list. STEP 3: Change anything you need to, but try to keep this article as Close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24, 000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again and again. PLEASE REMEMBER that this program remains successful because of the HONESTY AND INTEGRITY of the participants and by their carefully adhering to the directions. Look at it this way. If you are of Integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a Good idea to wrap the 1 bill in dark paper to reduce the risk of mail Theft). So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the...1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only 6.00 (1.00 for each of the first six people listed above) Send it now, add your

own name to the list and you\'re in business!
---------- DIRECTIONS FOR HOW TO POST TO NEWSGROUPS----------

STEP 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and Drag your cursor to the bottom of this document, and select \'copy\' from The edit menu. This will copy the entire letter into the computer\'s Memory.

STEP 2) Open a blank \'notepad\' file and place your cursor at the top of the blank page. From the \'edit\' menu select \'paste\'. This will paste a Copy of the letter into notepad so that you can add your name to the List.

STEP 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you\'ll always have this file to go back to.

STEP 4) Use Netscape or Internet explorer and try searching for various Newsgroups online forums, message boards, chat sites, discussions. (Just example you log on any search engine like yahoo.com, google.com, Altavista.com, excite.com then you search with this subject millionaire Message board, or money making message board, or employment message Board, or money making discussions, or money making forum, or business Message board etc. You will find thousand & thousand message boards.)

STEP 5) Visit these message boards and post this article as a new Message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a Particular group, click the post message button. You\'re done with your First one! Congratulations...THAT\'S IT! All you have to do is jump to Different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200 That\'s it!

You will begin receiving money from around the world within Days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. REMEMBER; PLAY FAIRLY and HONESTLY, and this will really work. Good Luck to you all!!!!!!!!!!!!!!!!!!!

A maintenance release. Most changes are internal, and there are no new features.

But a few pseudo ops have been enhanced a bit, a couple of bugs have (hopefully) been quashed, and it ploughs through assembler source code a little faster.

We're offering all the latest factory pressed high quality dvd movies,
ps2, psp and xbox silvers with factory printed colour inserts at
fantastic prices, whether for personal use or reselling. We're shipping
worldwide with various shipping methods. For resellers, please contact
us for bulk discounts.

For a complete list and prices, please email us at
movieworld77@time.net.my

(Please state the type of list that you want and tell us your location
as the prices varies for different locations. If you're reseller,
please state the quantity you wish to order per shipment and we'll
quote you a wholesale price depending on the quantity ordered.)

* If you need references, we can provide them to you.

5882. [annc] Dis6502 2.2 released

Newsgroup: comp.sys.atari.programmer
Date: 2006-05-31 15:37:44 UTC
From: Slor <semaj@rols.ten>
Message-ID: <Xns97D4764BCAD3Demuslor@216.196.97.136>

```
http://sourceforge.net/project/showfiles.php?group_id=145747

Version 2.2
-----------

No new features

Fixed bugs:
- recent files and recent workspaces did not work in 2.1. Fixed.
- Opcode $96 produced a bad disassembly.
- Version 2.1 did not work on Win98se.

5883. ST Book - Replacing Hard Drive

Newsgroup: comp.sys.atari.programmer
Date: 2006-06-01 01:02:12 UTC
From: Tom Tom <sometomtom@tomtom.com>
Message-ID: <o0rfg.12018$VL2.2365@trnddc06>

A friend of mine has had his hard drive die inside of his ST Book. There's
a few questions that I hope some experts here may be able to answer.

Do you know by chance if the format of the drive is the same as the regular
ST or if it is the same as the TT/Falcon?
Since the drive is IDE, can any drive be used in it or does it require
certain models?
What means will the drive need to be formatted and with what software is
recommended?

Appreciate help anyone can give to answering these questions.

Regards,
Glenn Bruner
glenn.bruner@verizon.net

Message-ID: <OIuEg.44301$vj1.28363@bignews5.bellsouth.net>
Source record: 11

Read this message until the end, and you will find out how the money flows in easy !!!!.
Follow the steps and it WILL work. Trust me !!!!!.

It's NOT illegal and it is NOT a scam !!!!!.

PROVEN ON OPRAH! Reported in the Wall Street Journal!!!!

The only thing you need is : - E-MAIL ACCOUNT
- PREMIER (FREE) or BUSINESS PAYPAL ACCOUNT
- $6 on this account (The only investment)
- 30 minutes of your time

There is no limit on how much money you can recieve, and you haven't got anything to lose with this Business program. I will explain how it works !!!!!.

Follow these 4 easy steps and it WILL work !!!!!.

STEP 1 : SIGN UP FOR A FREE PAYPAL ACCOUNT !!!!!.

Paypal is a free and safe way to pay and receive money on the Internet.
Creating a account is as easy as creating a MSN account.
Copy and paste the next line in your Internet browser and sign up.
HTTP://WWW.PAYPAL.COM

Be sure to sign up for a FREE Premier or Business account and not for a Personal account. You cannot receive CREDITCARD payments with a Personal account and we can't have that. Do we !!!!!.

STEP 2 : SENT $6 TO YOUR PAYPAL ACCOUNT

This is your only investment to receive the money with ease.

With your Paypal account, send $1 to each e-mailadres listed below.
!!!!! IMPORTANT !!!!! Be sure to use this SUBJECT : *PLEASE PUT ME ON YOUR EMAIL LIST* when you send the money.

1) martine@pilote.net
2) dexxatol@netcourrier.com
3) armygirl8568@hotmail.com
4) comjii@starband.net
5) sinnek@bellsouth.net
6) nsi@nelasat.com

STEP 3 : PUT YOUR E-MAIL ADDRESS ON THE BOTTOM OF THE LIST

After you have send $1 to each e-mail address, put your e-mail address on the 6th place.
Remove e-mail address number 1, and move each e-mail address 1 step up the ladder.
!!!!! IMPORTANT !!!!! BE SURE THAT THE E-MAIL ADDRESS YOU USE IS THE SAME AS YOU USED TO SIGN UP AT PAYPAL.

Remember that this is LEGAL. You are creating a service : an e-mail servicelist.

STEP 4 : UPLOAD OR COPY THIS MESSAGE TO NEWSGROUPS, FORUMS ETC AND EMAIL IT TO ALL YOUR FRIENDS!

There are 32,000 newsgroups. Upload or copy this message to at least 200 newsgroups or forums etc, but ..... remember that the more your upload the more people will see your message and the MORE MONEY WILL FLOW IN.

How to upload to newsgroups and forums? :

After you have followed step 1,2,3 and 4, save this message (and copy so you can use it again).
Use your Internet browser and Outlook Express or another newsreader and try to find FORUMS, NEWSGROUPS,
BULLETIN BOARDS, DISCUSSION GROUPS, CHAT SITES and ONLINE COMMUNITIES. Use GOOGLE or use a NEWSERVER.
Use every option to post this message. Download PostXpert to send 1 message to more NEWSGROUPS at the
same time.

!!!!! REMEMBER !!!!! The more you post this message the more MONEY WILL FLOW IN.

Why does this Business program work so well !!!!!.

Lets asume that from the 200 (or more) messages that you have posted, only 5 people respond, you will have your
$6 back that you have invested. Those 5 people will each send at least 200 messages with your e-mailadres on
number 4. That's 6 x 6 x $1 = $36. The next 25 people will also send 200 messages with your adres on number 3. That's 36 x 6 x $1 = $216. The next 216 people also send 200 messages with your name on number 2. That's 216 x 6
x $1 = $1296!. Those 1296 people again also send 200 messages with your name on number 1. That will give us a total of 1296 x 6 x $1 = $7,776.

Now the last tier! 7776 x 6 x $1 = $46,656!!!!!!

This is only a EXAMPLE with 6 reactions. You WILL get MORE responses than that.

Remember that most newsservers will leave the posted messages on there servers for about 2 weeks. If you will post your message again, it WILL again start from the beginning. So you can repeat this over and over again.

Everyday MILLIONS of people are ONLINE and reading these messages, JUST LIKE YOU RIGHT NOW. I also was sceptical in the beginning and have read a lot of these messages. I also thought that it was bullshit.
Until I thought : What the hell!, only $6. What's $6 and a couple of minutes of my time to solve my money problems.

!!!!! REMEMBER !!!!! Follow every step, and IT WILL WORK, TRUST ME. !!!!!

!!!!! BEST WISHES AND GOOD LUCK !!!!!

w)O>+;)<9UVS;F>qaGL<Uq#v`V6(F]- rM;$g+!4IIQ*827?H4

5893. gfa memory string etc help

Newsgroup: comp.sys.atari.programmer

Source record: 12

```
any body out there willing to advise novice programmer a "how to "
approach for correct memory mapping within a gfa program.... i reserve
a blank string of 9000 spaces
smf$=space$(9000)
then poke it ,...but once data within string is cleared and redeclared
clr smf$
now redeclare
smf$=space$(9000)

it "fumbles " another variable,so basically i have no problem at all
untill i reestablish a string ,then in turn it altres another variable
which is an interger.................puzzeled??????????

thanks in advance,charles
```

Hi!

> it "fumbles " another variable,so basically i have no problem at all
> untill i reestablish a string ,then in turn it altres another variable
> which is an interger.................puzzeled??????????

No, not puzzled at all. Puzzling is your way of describing a problem ;-)
Some source code would help but I think what you do is something like this:

LET smf$=SPACE$(9000) ! string of 9000 spaces
LET smf_adr%=V:smf$ ! get address of those 9000 bytes
@do_some_poking(smf_adr%) ! poke some stuff at this address
LET smf$=LEFT$(smf$,5000)+SPACE$(4000) ! clear last 4000 bytes
@do_some_poking(smf_adr%) ! do more poking

and BAM! Right?

This is because the string management of GFA is dynamic! The string data
can always be moved by GFA. It does this when it makes a garbage
collection (= cleaning up old unused strings)
So whenever you do a GFA string operation or call a subroutine the data
of your string may have changed.
So in the above example the first GOSUB was already dangerous...

Here are 2 alternatives with fixed addresses:

1. Use the operating system

LET smf_adr%=MALLOC(9000)
' do your stuff
~MFREE(smf_adr%) ! please do not forget to free RAM after use

2. Use GFA-Inlines (only V3.6)
INLINE smf_adr%,9000

With those 2 methods the address never changes during a program run.

If you want more help on GFA just ask, but please be a bit more specific
and if possible provide some example source code. Thanks!

Cheers, Ingo =;->

Also you can use the oh-so-handy GFA arrays, like

DIM piece_of_mem|(9000)
addr%=v:piece_of_mem|(0)

You can start poking then at addr% to addr%+9000, or, if you prefer,
use the array as each indice of it is one byte. Thus:

poke addr%+303,123

is the same as

piece_of_mem|(303)=123

Another good thing with dim is that you don't suffer from malloc
taking up RAM each time the program fails. Oh, and the chunk of memory
can be as large as you want.
```

Hope this helps,

Hello Tom Tom!

> Do you know by chance if the format of the drive is the same as the regular
> ST or if it is the same as the TT/Falcon?

The "format" of the ST-Book-Drive is a 2,5"-drive as used in
notebooks/laptops.

> Since the drive is IDE, can any drive be used in it or does it require
> certain models?

If I remember corectly these machines had problems with drives bigger
1GB capacity, so if you find somewhere a 500MB-drive it should be
possible to install.

> What means will the drive need to be formatted and with what software is
> recommended?

Is there a "format-software" (AHDI sp?) in ST-Books permanent RAM-Drive
(I don't remember...)
Otherwise the best chance is to take a FALCON (only other Atari-machine
with a 2,5"-drive"), put the "new" ST-Book-drive in it, format with the
software from the "language-disk" or third-party-software as "HDDriver",
and put this drive then in the ST-Book.
Voilà - Should work...

Best Regards, Werner

well guys i resolved the problem , and a real big thanks for the new approch at peeking and poking ,still kinda new at programming ...it works great so far and the solution was to remove the clr smf$,smf%.....i don't know why but if this is in a loop and parameters are cleared then reinvoked like

```
do
star$=space$(4000)
star%=varptr(star$)
poke star%,asc"s"
poke star%+1,asc"i"
poke star%+2,asc"m"
a=2
do
a=a+1
poke V:star$+a,number
loop until inkey$<>""
clr star%,star$
loop
```

i know not very accuret example but had to do with clearing and then redeclaring variables within a continuing program.

thanks guys
"we make a good team"....even though we are sppread miles apart.

charles

>do
>a=a+1
>poke V:star$+a,number
>loop until inkey$<>""
>clr star%,star$
>loop
```

Just as a friendly bit of advice, I hope your program has some error and/or boundary checks in place. If not, and you use a construct similar to this snippet taken from above:

```
>star$=space$(4000)
>star%=varptr(star$)
>poke star%,asc"s"
>poke star%+1,asc"i"
>poke star%+2,asc"m"
>a=2
>do
>a=a+1
>poke V:star$+a,number
>loop until inkey$<>""
```

you're going to have a big problem with buffer over-runs, random data corruption and/or crashes. From the loop above, you've not long at all before 'a' exceeds the allocated space (4000 bytes) and the next poke overwrites something important. With it being interpreted, you'll probably have a few seconds to press a key to exit the loop. Once it's compiled, you're going to be down to a few 1/10ths or even 1/100ths before the damage is done.

David Bolt

Pros:
Can allocate memory blocks (much) bigger than ~32000 bytes.
The block isn't stored as a part of the program[0]

Con:
Forgetting to free the block is a good way to create memory leaks.
The block isn't stored as a part of the program[0]
You need to shrink the memory allocated before you can use Malloc[1]

>2. Use GFA-Inlines (only V3.6)

Inline was actually included as of v3.00

>INLINE smf_adr%,9000

Pros:
No need to free the block so no way to create memory leaks.
The block is stored as a part of the program

Con:
Can't be more than ~32000 bytes.
The block is stored as a part of the program.

>With those 2 methods the address never changes during a program run.
>
>If you want more help on GFA just ask, but please be a bit more

>
>Cheers, Ingo =;->

[0] Both a pro and a con. Useful as it means the program itself is
smaller on disc, or a hindrance if you have to load data from disc into
the block.

[1] Certainly in the older interpreters (3.0 - 3.5). Don't know if the
same applies to newer versions.
```

[2] Also both a pro and a con. Useful as you can keep data as a part of
the program and not have to load it from disc, or a hindrance in that
the program size is increased by the size of each INLINE.

Hello Tom Tom!

> Do you know by chance if the format of the drive is the same as the
> regular ST or if it is the same as the TT/Falcon?

The "format" of the ST-Book-Drive is a 2,5"-drive as used in
notebooks/laptops.

> Since the drive is IDE, can any drive be used in it or does it require
> certain models?

If I remember corectly these machines had problems with drives bigger
1GB capacity, so if you find somewhere a 500MB-drive it should be
possible to install.

> What means will the drive need to be formatted and with what software is
> recommended?

Is there a "format-software" (AHDI sp?) in ST-Books permanent RAM-Drive
(I don't remember...)
Otherwise the best chance is to take a FALCON (only other Atari-machine
with a 2,5"-drive"), put the "new" ST-Book-drive in it, format with the
software from the "language-disk" or third-party-software as "HDDriver",
and put this drive then in the ST-Book.
Voil&#65533; - Should work...

Best Regards, Werner

General problems with IDE drives bigger than 1 GB are unlikely because
there is no IDE-specific limit at this size. Provided the ST-Book has a
standard IDE interface, which I think it has, there are no limits that
do not also apply for other Atari machines.

Wasn't there a Atari-specific problem with drives (or partitions) bigger
1GB? They could't adress such big storage-devices IIRC.

There is a TOS specific limitation regarding partition size. Early STs
had a limit of 256 MB per partition. Most other TOS versions have a
limit of 512 MB per partition, except for the Falcon (4.0x) TOS which
can access 1 GB per partition. MiNT (a multitasking TOS replacement)
can go to the TB range. With 14 partitions possible, your ST Book can
access 7 GB total via its built-in operating system.

Hi ProToS,

The HighWire CVS has not changed. What url are you
using to access the cvs?

You must use 'highwire.atari-users.net' as the url. NOT
'atari-users.net' or 'atariforge.org or .net'
I think 'sparemint.org' should work also.

If it's something different.. let me know.

Rob

5913. RS232 question

Newsgroup: comp.sys.atari.programmer
Date: 2007-02-03 19:49:37 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <45c4e751.0@entanet>
Source record: 32

Hi all,

Last year I built a circuit that allows me to connect my Suunto dive computer to a PC and download the dive log using the Suunto software. After some strange problems it worked.

I also wrote a programme for the Milan to download the log but couldn't get it to work. I then found EonTools and ported it to Mint but it behaves the same.

http://www.streit.cc/dive/index.html

The interface connects from the RS232 to the 3 metal contacts on the front of the Suunto.

The Suunto is activated in dive mode by connecting it's 3 metal contacts together. This happens when I jump into the water.

To download the data from the Suunto has to be placed into log mode by toggling through the menu using the metal contacts and wet fingertips.

However, when I plug it into the interface the 3 contacts on the interface are all at the same potential and so it switches into dive mode before the download can start.

What I want to do is to stop the Suunto resetting for a few seconds and then start the download. I am hoping that there is a command I can send to the RS232 that will stop the 3 contacts from being at 0 volt.

The Suunto windows software probably does this in some way but I don't know how to do it.

Can anyone help ?

Peter

Without the schematic of the interface, it is difficult to tell what is
happening. Generally, all output pins of the RS232 port will not be near 0V
- neither the ST/TT nor the Milan has a shutdown feature on these pins.

Not sure - that might depend on the adapter. IRDA is both hardware and
software, so the software part of the IRDA protocol will probably need to be
implemented on the computer. I do not know if there are intelligent adapters
that handle this on their own.

I don't know anything about GFA, but there's a bunch of GFA coders on comp.sys.atari.st. You may have better luck over there. This newsgroup is as good as dead now.

Also on IRC (chanel #atariscne) you will meet GFA coders.

Good luck anyway,

JFL

I had a look at FreeBSD and OpenBSD and there are a few mentions of
some something called birda but I couldn't track down any source code
for it. It drives a serial irda device.

The irda "driver" may have been added to the kernel, I couldn't tell.

well i wish to aquire as much knowledge as i may.
the first is how to display an image ...i guess its simple right ,
inline the image and use put to diplay ,,,but what about images within
resources , is there some pixel to co-ordantes convert ?

i should just irc somebody , charles in canada..

it about pointers to data image and then display picture back
properly ..

charles

no !!try it lonny ...
go to a resource editor ---orcs or interface make a image .
then try to display as root image /object , i can't seem to do it .

sure , its possiable within a form , easy to make a form then have
image as child to the form ,but,..... i cannot seem to draw up an
image as the sole resource... crazy yet ?, i am!!

charles

hi all, i have recently decided that gfa was not a suffienct language
to program with and have since then made a change to pascal...good
grief what a tangled mess!!!!!!! , but.....
if any one is willing ,who reads this,and can offer advice in any way
shape or form .... towards a practical approch to pascal programming
on the atari , i will gladly accept...

a little reference and guidence needed

thanks
charles

yes i post this identical message to other atari groups aswell.

5929. GCC 4.2 available

Newsgroup: comp.sys.atari.programmer

Hello, ST lovers !

A new port of GCC 4.2 and binutils 2.17 for the Atari ST is available here:
http://vincent.riviere.free.fr/soft/m68k-atari-mint/

Cygwin binaries are included, allowing you to cross-build ST software from
Windows.

Vincent Rivi&#65533;re
vincent.riviere@freesbee.fr

It's an alien virus sent from the planet Neptune
The chicks all have three tits and their vagina
is where their left ear and had several rows of
sharp teeth waiting to chomp down on any sort
of probing invader,

Be sure to look close at the spider pig Homer
is walking across the ceiling leaving tracks of
some sort of sticking dark matter - that chases
Marge out the door of the room screaming in
'The Simpsons Movie'. Turns out the Spider Pig
was an alien from Neptune.

does any body have any good pascal manuals or links.
i recently took up pascal programming on the atari and found a need
for some instruction..

thanks
post here or email to me

charles.copp@sympatico.ca

5941. teens fucking vidios free, telugu vidio songs, tenn sex vidios, tenn vidio clip free

5946. Power-off by software

Newsgroup: comp.sys.atari.programmer
Date: 2007-11-24 10:20:53 UTC
From: vdjole@EUnet.yu
Message-ID: <fi8tu4$47p$1@news.eunet.yu>

Hi;

I was told that on some Atari clones power can be switched off by software.
Can someone supply more information on how this is achieved- i.e. by a call
to a (X)BIOS function, direct access to certain address, or...

Is the same method used to shut down Aranym?

thanx in advance

Djordje

For the CT60, it's writing to a specific memory location. See CHG.PDF from Rodolphe Czuba's web site.

Sorry, don't know ...

Roger

The Milan is a pre-ATX design (even the Milan 2 which uses an ATX power
supply), so it can not be turned off by software.

5949. Volume control on Falcon?

Newsgroup: comp.sys.atari.programmer
Date: 2007-11-30 07:59:51 UTC
From: Matthias Arndt <marndt@asmsoftware.de>
Message-ID: <ngs425-vm5.ln1@www.final-memory.org>
Source record: 69

Hello,

can anyone tell me how the Master Volume control does work on a plain
Falcon with the FSOUND.CPX? I've consulted a hardware register listing
but couldn't locate something for this.
I don't mind direct hw access and code for plain TOS in mind. I don't
care at all if it breaks MagiC or MiNT.

thanks,
Matthias

5951. Hello, anyone wants to try my program.

Newsgroup: comp.sys.atari.programmer
Date: 2008-01-11 17:00:57 UTC
From: Argi <kivernitis@mail.gr>
Message-ID: <fm87cb$27h$1@mouse.otenet.gr>
Source record: 70

Hello, anyone wants to try my program.
It generates on every run 8 rows of six numbers.
So, you play almost all the numbers, (except one - never mind ;-)))
It is difficult to play all the numbers only with the pen, difficult to find
what numbers you didn't play. So this program makes easy to do it.

I have more programs to upload in the future, stay tuned.

Good luck

Argi

You can try bataribasic @ bataribasic.com and see if that "kit/system"
helps. I personally found it easier to use then 6502 Assembly.

5955. FS: ATARI 800XL working (?) incl videocable, monitor is extra for shipping, also cartridge (nonworking?, Citibank unknown applications)

Newsgroup: comp.sys.atari.programmer
Date: 2008-06-16 00:02:36 UTC
From: Mark Licetti <MetalBladeNOJUNK@NOJUNKprodigy.net>
Message-ID: <eWg5k.8303$jl5.1824@flpi148.ffdc.sbc.com>
Source record: 74

I have Atari 800XL system, main, CPU or "console" unit - whatever it was called (I am not an expert on vintage computers/games). Owner claims it WORKS FINE, but since Chess Game memory cartridge failed they never used it, chess was the only thing they cared for. There's another cartridge from Citibank and I dont know wha tit does, I am quite sure main unit works. Video cable is included, even monitor is available but I doubt anyone wants a small CRT whitish monitor these days, it's probbaly better to hook up to a modern monitor thru some sort of connector adapter. I have connectorized videocable for it.

Main unit looks like a keyboard integrated with CPU/mainboard, it's clean and owner says it works. Any interest?

Do NOT reply on Newsgroup, email instead and REMOVE "NOJUNK" strings in my address.

Best if transaction is conducted on Ebay 9for safety) - my Ebay feedback is 100% positive, not to mention a DECADE of Newsgroups trading without any complains.

Monday, July 14th 2008,

the long awaited cracked additional modules for Cubase sequencer are now out! All disk protections have been removed!

- Studio Module : The Total Recall Studio Organizer. Manages the settings for all your synthesizers and other MIDI Devices.
- StyleTrax : The Accompaniment Tool. Make music in seconds with the Styles that are included, or create your own in minutes.
- CueTrax : The Graphic MasterTrack Editor. An essential tool for anyone making music for film or video.

These modules are compatible with Atari versions of:
- Cubase Score
- Cubase Audio (CAFCRACK packages included)
- Later versions of Cubase 3.x (For example, 3.01 is excluded contrary to 3.10)

I advise to put STUDIO.MOD, CUETRAX.MOD and STYLTRAX.MOD files in MODULES folder. Before loading Studio Module, you MUST create a STUDIO.DAT folder in current Cubase program folder.

Studio Module (v1.02 package):
http://jeanpatatari.site.voila.fr/modules.add/STUDIOJP.ZIP

Studio Modules (v1.06a, v1.06c, v1.07a):
http://jeanpatatari.site.voila.fr/modules.add/STUDADJP.ZIP

Studio Module driver editor:
http://jeanpatatari.site.voila.fr/modules.add/DMAKER.ZIP

CueTrax Module:
http://jeanpatatari.site.voila.fr/modules.add/CUETRXJP.ZIP

StyleTrax Module:
http://jeanpatatari.site.voila.fr/modules.add/STYLTXJP.ZIP

Special thanks to JLC!

Jean Pat

LS

Finally, after many years of intermittently hard work and
letting myself be distracted by the many beautifull things in a world
that is not entirely made up/out by/of computers, AHCC has reached
a usable state.

AHCC is a replacement for the renown but propriatary Pur C compiler.
AHCC is binary and almost source compatible to Pure C.

You can download AHCC from my homepage (in sig).

The version number is 3.b1
3 after Sozobon v2, b1: the first beta release.
The language version is C89.

Please, please, before you go fiddling, read the hypertext
in it's entirety first.

If things are unclear or if you think the hypertext is too
concise or incomplete, send me a mail.

Have fun.

Hi,

Many thanks for AHCC that I don't already tested, but I will !

That's really kind of you to suggest users to report directly.
I hope not to importunate if I do. I'm always looking forward
to know about projects you're developing. That helps a lot !

Best regards,

This is very good news :-) I will download and test it as soon as I have
repaired my Milan.

```
LS

There is a new version of AHCC available. (see sig)

Changes:
AHCC now detects and inhibits infinite recursions
during macro expansion. (v3.b1 crashed)

Fixes in relative path handling.
More flexible handling of shel_find result.
Built in macro __FILE__ changes '\' to '\\'.

Have fun.

```
LS

For those who already downloaded the last AHCC.

Please do it again.
There is a last minute fix and I forgot a few files.

Apologies for the inconvenience.

5966. AHCC V3.b3

Newsgroup: comp.sys.atari.programmer
Date: 2009-03-19 12:57:00 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <7d5c7$49c2414a$4dfbcd14$13313@news.chello.nl>
Source record: 85
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my home page (see sig).

Changes since v3.b2:

Fixed a omission while expanding.
(K&R 2nd A12.3 dont replace at rescan.)
My solution of recursive macro expension yielded
false positives. So it is removed.
It might be necessary to completely redesign the
expansion mechanisms. The current implementation is a
Sozobon legacy. AHCC should work fine when you remove
all recursive definitions and usage in your sources.

A memory bug is killed.
A few minor bugs fixed.

The Pure C offsetof macro couldn't work in #if's
(again, Sozobon legacy).
Implemented __offsetof__ operator.

If your programs use offsetof in a #if conditional
and you do not use the stddef.h of AHCC,
you must copy the implementation of offsetof from stddef.h
in folder AINCLUDE to your own stddef.h.

Handling of # (stringify) and ## (token catenation)
same as Pure C (Not entirely ANSI).

5969. AHCC V3.b4

Newsgroup: comp.sys.atari.programmer
Date: 2009-11-25 15:53:08 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <31e51$4b0d52f1$4df94c07$8425@news.chello.nl>
Source record: 88
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

LS

AHCC is a Pure C compatible C compiler.

There is a new version available on my homepage (see sig)

Summary of changes:

Assembler:
Fixed a memory leak;
C preprocessor activated in .S files
While doing this, it appeared that AHCC never checked
if a preprocessor command was the first of a line. :-(
This is now repaired.

.global
.org
.equ and .set second form
.ascii
.asciil
.asciiz
.page

option -*u default .super

Repair broken exg An,Dn

Allow mixed register lists of form:
Dn-An (ascending register number) --> Dn-D7/A0-An
An-Dn (descending register number) --> An-A0/D7-Dn

Option -*w to set default size for Xn (no dot).
default (option not set) is word.
Also fixed a bug in determining the Xn size.

Compiler:
Activated and fixed option -x prepend underscore.
Fixed occasionally incorrect line number in messages.
#warning
__func__ identifier and its synonim __FUNCTION__
case: long constants allowed
Fixed stupid mistake in constant validation since v3.b3
Typos in constant folding for <= and >= (wrong way around)
Not detected until compiling emutos :-(

Negative absolute operands handled correctly.
Removed '#' from #warn, #error messages.

Less cryptic message for mismatching pointers to function.
Sometimes the Help opened the wrong file.
Fixed by restructuring the Help DataBase.

Allow 'formal' declaration of arrays by specifying
empty [] pair. e.g. static char forward[];

It appeared that if flag 'cdecl calling' was set,
functions returning a pointer returned in D0, wereas the
callee expected the pointer dtill in A0.
Probably a relic of a distant past.
Pointers are now always returned in A0.
Fixed another bug in 'cdecl' calling in combination
with __syscall__. (a2 wasnt reserved)

Incrementing a void * wasnt warned nor handled sensibly.
Arithmetic to unscalable pointers is warned and not scaled.

Fixed wrong handling of absolute Lvalues and references.
Fix and improvement of rare optimization incidence.
Fixed a bug in implicit dereferencing of callee expressions.
e.g. (a ? c : d)(arg);
Fixed a terrible regression in constant casting.
Casting int to float was lost somewhere.
Fixed a bug in long pointer scaling in 68000 mode (-2-)

Linker:
Fixed a memory bug for libraries with excessive
number of names. (more than 1359)
Result of a nested project was not correctly passed
and the linker was not called. Fixed.
'Linking' message gives name of project file.
Object files are linked in the order in which they
appear in the project file.

Build a ROM image:
Option -t=N N is startaddress of text+data sections.
bss start will be set at 0.
-i=N N is size of image in kilobytes. (zero padding)

Make sure ALL areas are of even size.

Shell:
KIT: button 'inherit options'
for nested projects, inherit options from parent project.

Editor:
Improvement of UNDO behaviour. UNDU after HELP.

```
Something is missing in the doc's

Compiling AHCC with either Pure C or AHCC:
the sinclude folder must be used.
Compiling CALC and DIGGER:
the ainclude folder must be used.

You can set this via menu:Project-->Config

AHCC_PRJ.TTP defaults to ainclude.

AHCC.TTP and AHCL.TTP are there for completeness
and never used by myself.

I am not interested in Unixoids and their scripting aphasiae.

I am, and I do test them from the command line, for various reasons, but I use the AHCC for editing (Qed does not like the tab chars) and overall project compiling.

AHCC_PRJ.TTP currently accepts a project file as the only parameter. If you dont mind, I will look at adding extra command line options, at least for includes and lib folders

Your testing of Teradesk lately has confirmed that I do not have libs set up properly, with command line this is much quicker to test (for me)

BTW can you post your fixes regarding the latest Teradesk test compile. At the moment I am stuck only on linking (under MiNT), having made minor adjustments to the sources, an wish to confirm those changes..

Paul

I do mind. The purpose of this program is to be able to drop a
projectfile on it via the desktop. Pressing ALT while dropping
forces a make all. I am fixing a problem with the .C [-I...] option
in the project file. The project file is the place to be for
include directories.
The same is true for the lib directory. I might have neglected
this, because I only use the GEM AHCC (lib via KIT).
I am investigating this issue.

AHCL accepts all input files, including libraries on the
commandline. Files are loaded in the order of the commandline
as long as there are unresolved references and kept in memory.
AHCL's reference matching is recursive, so this order is not
vital. However the input will appear in the executable
binary in this order. To start the recursive reference cascade it
is necessary that the first file must reference something.
Most startup codes do this by refering to main.

This is how it is designed, I never ran AHCL.
It should work because AHCC uses a internal calling mechanism
that mimics the commandline.

The last time I have typed a commandline was in 1985 when
I got payed for it. And it wasn't even Unix, but ICL 2900 VME/B's SCL.

What exactly is the problem?

>, having
> made minor adjustments to the sources, an wish to confirm those
> changes..

about jmpa6:

```
#if __AHCC__
void __asm__ jmpa6(void)
{
addq.l #4, sp /* adjust stack; jmpa6 is called */
jmp (a6)
}
#else
void jmpa6(void) 0x4ED6;
#endif
```

A new AHCC is not ready yet.
I found two more issues, which I am investigating.
They are rare. Only occurred until now.

:-) Your involvement pays off.

```
LS

AHCC is a Pure C compatible C compiler for GEM.

There is a new version available on my homepage (see sig)

Changes:

Shell:
Very, very usefull:
New menu entry Project->Edit ALT+P
Loads the current projectfile in the editor.
Open->Open .P* removed.

menu entry 'Find selection in project' now also in the journal.

KIT: button for option -*u (default .super in assembly)

Compiler:
Improved include file lookup.
Now Teradesk compiles directly from its own directory.
Teradesk compiles without 'inherit options'.
The need for setting a include dir in the KIT is almost
never needed when -I's are in the project file.
This is also beneficial for AHCC_PRJ.TTP. There the default
to ainclude is removed.

Made a lot of error/warning messages a lot more readable.

Completely forgot about relative long branches in the
output phase. :-( Fixed.

Fixed a regression and a closed loop while generating switch
tables. (related to allowing long 'case' constants)
It happened when a case value forms a negative short.

typechecking of call's:
p(); or p(void); /* declaration */
........
p(); /* call */
Is no longer warned. The mixing of old and new syle is silently
accepted when no arguments are involved.

Same for declarations:
p() or p(void);
followed by
p(void){...} or p(){...}
```

Bugfixes for rare cases involving boolean comma expressions
and pushers.

Assembler:
Fixed ordinal in "out of range" message for shifts.

Fixed a serious regression when combining C and Assembly in a file.
(message: CE: invalid asm area number)

Accept include filename between ampersands.
For the moment the warning persists and can be ignored.

There is a new version available on my homepage (see sig)

Only 1 bugfix.

A zero pointer dereference.

This did not much harm and was not detected on a 68040,
but causes a miserable crash on 68030.

Happily I did not trash my precious TT.
Dont trust software from Milan only users :-P

(With the b6) There still seems to be an issue with AHCC finding files, it is a case thing

I am using AHCC from FAT drive C: (supports: upper case only)

The TeraDesk folder is on a MINIX partition E: (supports: upper case and lower case and mixed case)

When the file names are all upper case as from the zip, AHCC cannot find the Project files listed at the bottom of the DESKTOP.PRJ file, when these are rem'd out, it cannot find the .C files.

When it says the files it cannot find, it always prints them in lower case.

When all file names are lower case (in the file system), the files are found (ARAnyM hostfs: lower case)

Compiling "btst.s" causes a crash, XaAES outputs:
pid 66 (AHCC): BUS ERROR:
User PC=163C856, Address: 0
(basepage=160E000, text=160E100, data=16519E8, bss=1663BB2)

The test system is EasyMiNT 1.70 for ARAnyM (ZIP from EasyMiNT page, uses MiNT 1.16.3)

I will try the same AHCC and source tree using standard AFROS setup (confirmed, same problems)

Paul

There you are.

All filenames, both in project file and #include in the source
are lower case. Works on TOSFS.
Works also on case sensitive or case preserving file systems
but only of course if all relevant filenames in the fs are lower case.
Mixed case makes things unpredictable.

I use a ZIP drive for transfering AHCC et al to my Linux box
to a case sensitive fs.
I can configure mount to treat all filenames on the ZIP as
lower case. So that is what I do.

> Compiling "btst.s" causes a crash, XaAES outputs:

I will try using the TOS drive again. I do know that case is an issue
when using MONST, but that it does work with a MINIX partition. (maybe
that is just a long filename issue)

I will try a test with the lower case file names on the MINIX, and the
EXT2, but from what you say, they will work..

```
LS

There is a new version available on my home page (see sig)

New:

General:
Changed the naming scheme of all the incarnations of AHCC.
The name of the project file is always the same as the
name of the executable. See 'distribution' in the hypertext.

Shell:
Close the project file. (problems saving after ALT+P)
Fixed a memory leak when compiling from a open window.

Compiler:
Create AHCCST.
A 68000 version without floating point support.

The header cache is always freed between make's.
It must also be freed between files when caching
is switched off.

Cached headers take about 30% less space due to
redesign of tokenized input format.

Another dereference of a zero pointer.

Library:
Fixes in stricmp, strnicmp & strtol.
Consistency check in AHCM (memory allocator).

I cannot predict what every Pure C user has put in his include folder.
The purpose of the include folder of AHCC is to at least have the
standard headers and ahcc_rt.h.

For the moment, local labels only work within modules.
Modularizing nkcc is a very good idee. The linker only picks

the modules that are called by a program.

> ------------------------------cut------------------------------

That is a correct solution. Without the #if the typedef is
evaluated twice.

The second typedef results in the following:
typedef unsigned long unsigned long;

Which is not valid C89, the typedef'd name (declarator) is missing.
Repetition of unsigned and long is taken for granted.

I dont know how Pure C or GCC look at this.
I have to lookup the standard.
I have tried to mimic Pure C, but didnt like the code.

The following is good and sensible C:

typedef long mylong.
typedef unsigned mylong size_t.

> Two things I miss in AHCC, at the moment:
> In PureC you can define a path for the object file which are make. So they are
> no between the sourcecode.

Never used that. So didnt think of it.

5985. pure pascal floating point other than single double extended real

Newsgroup: comp.sys.atari.programmer
Date: 2010-02-07 15:25:38 UTC
From: charlie <charles.copp@sympatico.ca>
Message-ID: <4aa0735e-aa84-489d-99df-8037955764d2@b18g2000vbl.googlegroups.com>
Source record: 104

hi i use pure pascal and it supports the range of values from byte to
real
but has no support for more than 1 digit before the decimal .

this means i cannot print 3456.78 or 123.4567

i think it usees fixed point math but no floats
is this correct?

i am a novice and probally take this element for granted when
programming on my atari,

the simplier languages used before bymyself like gfa or omikron never
generate such unabilites

...so my question is" is ther a method to print out these larger
numbers and fraction of numbers"

single,extended,double and real are only decimal number supported in
pure pascal...

last but not least
do i have to make two variables to consume the floating point value?

charles

That was my mistake I'm thinking that ATARIERR.H is from PureC, but now I see
is not.

> Modularizing nkcc is a very good idee.

You mean that every function one file?

> I'll have a look.
> No promise.

Thanks.

What will AHCC say me if it write:
OE: fmove fpn,<ea>, NO DST

Gerhard

No, put the Pure C

module <name>
endmod

around each nkcc function.

But if you use the nkcc from Harold Siegmund's site
I will do that for you and put the result in AHCC's lib directory.

If you have made changes, send me your version.

>
> What will AHCC say me if it write:
> OE: fmove fpn,<ea>, NO DST

That is a internal error.
Send me the file (and its includes) that causes it.

It is not nrcessary, the cflib use only some function from the original source.
I change it and it works.

Gerhard

I fell in love with the net and all the compuiter teahcnology in the very early years and have loved it ever since, I have an IT Degree and Communications degree and will be working on my doctorate for the next five years, in bwetween I design websites, databases, Multimedia Produxction or anything that wil make me a penny, just student scraping by. But Guess what? I don't want your money, your e-mail, or anything. Each of these sites has a specific topic but they have them style and layout sothey are easy to navigate and ther a search function should take you to exactly where youwant to, or just explore, they have outside service you can acccess as well. Each site has 10,000 plus articles and they are updated everyday so you know you are gettin up to date information. ENough, here the computer and tech related sites.

5993. AHCC V3.b8

Newsgroup: comp.sys.atari.programmer
Date: 2010-03-17 22:28:16 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <1a332$4ba157b7$4df94c07$3267@news.chello.nl>
Source record: 112
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my home page (see sig)

Changes:

Compiler:

Option -7 preliminary Coldfire V4e target.
=========================================
See also: Status of Coldfire support.

Fixed Option -c- No nested comments didnt work.
Fix in option -*i (32 bit int)
error 'no declarer for extern object'
changed to warning, default is 'int'.

New warning: 'no prototype for 'name'.
warning: 'no args matching' only if there are args to match
and only for old style prototypes.

Removed option -4 (double is float)
Removed option -*s (scale 32)
It appeared that Pure C does long scaling the same way
without being optional.

A few small fixes for very rare situations.

Removed a spurious call to a diagnostic print routine.
Reduces all binaries by about 7Kb.

Relaxed a limitation on the number of names in the Pure C
object output format.

Linker:
Improved load map.
All symbols are printed.
Local symbols are enclosed by < >.

Option -n: Write a 'nm' style list of symbels to prog.SYM

DRI symbol table in executable:
write symbols first 22 characters in stead of first 8.

Assembler:
Allow size .b in Scc instructions.
Detection of '*' comment in lexer.
```

new directives: (from devpac)
incbin
include a binary file as is at the current position.

section
allowed operands: text, data or bss.

Library:
Merged ainclude and sinclude folders.
ainclude is now obsolete and removed.
The sinclude folder can be used for both Pure C libraries
and AHCC libraries.

All 16 bit integrals in sinclude are declared as short !!!!

FILE structure of AHCCSTD.LIB compatible with the one
of Pure C lib. (Needed for fixing AHCCSTD ;-)

Fixes in AHCCSTD.LIB

Changed name of folder from AHCCLIB to AHCCSTD

Update wind_get. (table of number of replies)

Have fun.

```
LS

There is a new version available on my homepage (see sig).

Changes:

may 27 2010
v4
Editor:
Better placement of windows with tiling.

Compiler:
Finished 68020 compatible Coldfire target. (C only)
Long mod (%) done by hardware for 68020+ and Coldfire.
Fixed a bug in AHCCST concerning assigning a variable
to a bit field.
Forbid duplication of enum identifiers.

Linker:
'nm' list: addresses always in hex.

Library:
Fixed binding for vsl_ends; Some VDI's acces intout.
Changed binding for v_gtext; Intin array static.
Replies and setting of errno same as Pure C lib.

5999. AHCC V4.1

Newsgroup: comp.sys.atari.programmer
Date: 2010-10-05 21:26:08 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <8f691$4cab987e$4dfbcd24$16380@news.chello.nl>
Source record: 118
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

LS

There is a new version available on my homepage (see sig)

Changes:

Compiler:
Further fixes for, and completion of Coldfire target.

Fixed a rare crash when compiling nnn.c when AHCC also
had open in a window a file nnn.s from the same folder.
It happened to me while I was rewriting nkcc.s into nkcc.c
:-)

Cdecl functions returning a pointer do so in both a0 and d0.

Assembler:
Accept ENDR after REPEAT.
Fix a memory leak in the 'ascii' opcode.

Library:
Set both variables _envp and __EnvStrPtr in ahcstart.c
Replaced getenv (gcc version) by getenv from dlibs.
Repaired enum HOURGLAS,BUSYBEE in sinclude\np_aes.h & aes.h
Removed a few leftover debugging printf's from AHCM

Shell:
Find multiple, Find in project:
Fixed line number counting for files with unix line endings.

Editor:
Window menu 'leave' behaviour changed. The menu is no longer
popped when left via the bottom of the menu.

Interactive disassembler: TT-Digger; http://digger.atari.org
A Home Cooked C compiler: AHCC; http://ahcc.atari.org

6000. AHCC V4,2

Newsgroup: comp.sys.atari.programmer
Date: 2010-10-29 22:14:10 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <d8698$4ccb47ca$4dfbcd24$16236@news.chello.nl>
Source record: 119
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my homepage (see sig).

Changes:

october 30 2010
v4.2

Compiler:
Removed error "bool not allowed".
Fixed a rare case where logical expressions with && or ||
including constants were not handled properly.
pe
if (VERSION == DEMO_VERSION && c < 0)
where upercase identifiers are constants and c is a variable.

Fixed wrong code for comparing a double to a integer constant.
Fixed assignments of the form a = b = c
where a and b are doubles.
Accept '=' with options -I, -D

Assembler:
Fix in preprocessor.
endif directive was not detected properly resulting
in "error 1 #endif missing".

implemented directives:
.extern, .ifne, .iff, .ifeq, .ifle, .iflt, .ifge, .ifgt

labels without ':' must begin at position 1 of a line.
This assures typos in opcode mnemonics are rejected.

Fixed 'wrong processor type' message.

Shell:
If AHCC cant find header files, setting maximum verbosity
will display in the journal which paths AHCC has tried.
(Maximum verbosity = all 4 v's in the KIT.)

Implemented project file option .S
.S options are passed when compiling assembler files.
(extension .S)
When the option is present it is passed to .S files only.
If absent, the .C options are passed to all source files
including .S files.
```

Editor:
Fix in detecting changes in files with Unix line endings
resulting in false positives when closing.
Undone changes were falsely reported as change.
Not dangerous but Annoying.

With option 'visible tabs' active, AHCC now also shows
trailing white space. Usefull when comparing files.
The small triangle is used.

When 'visible tab' is inactive, compare files (^2) no longer
takes trailing white space into account.

So, when 'compare folders' marks files as changed and ^2
doesnt find a change, you can be sure that its only trailing
space that is the difference.

6001. AHCC V3.4

Newsgroup: comp.sys.atari.programmer
Date: 2010-11-28 22:06:29 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <14030$4cf2d30a$4dfbcd24$22012@news.chello.nl>
Source record: 120
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my homepage (see sig)

Changes:
november 28 2010
v4.3
Compiler:
Fixed wrong mode bits in Coldfire 'fmovem.d reglist,(A7)'.
Fixed typo in "unknown mnemonic" message.
Skip rest of line after above message.

Improved code for comparing bitfields to zero
and assigning constants to bitfields.
Replaced flagwords operated by |= resp. &=~ by
bitfield definitions.
For instance:
in stead of 'flag |= FLAGNAME resp. flag &= ~FLAGNAME',
now 'flag.flagname = 1 resp. flag.flagname = 0'
without increase of code.

Repaired warning 'value too big for field',
which was never issued due to a typo.
Also made sure the generated code conforms to Pure C
in this case.

The include folder can now be used by both Pure C and AHCC
in all case. The sinclude folder is only needed when
compiling AHCC* itself.

Assembler:
Implemented directives 'ifd' and 'ifnd' as synonyms
for 'ifdef' and 'ifndef'.

A expression of the form (label1 - label2) can only be
resolved when the labels are NOT advance references and
when the labels are in the same area (or module).

This might be repaired in the next release. It will
take some contemplation and time.

If you are still stuck with this, have a look at the Pascal formatting of
real values.

```
myRealNum := 1234.123456789;
writeln (myRealNum:4:3);
```

will IIRC display the value like this 1234.123

You might wish to trunc() or round() it to something more sensible.

6004. Windom DFRM

Newsgroup: comp.sys.atari.programmer
Date: 2010-12-15 14:25:41 UTC
From: p.slegg@sNcOuSbPaAdMivers.co.uk
Message-ID: <ieaj54$10vr$1@news.enta.net>
Source record: 123

I am experimenting with the Windom extension DFRM and having
some trouble with radio buttons. Are there any Windom experts
who can guide me ?

I can create radio buttons and select the defaut one, the problems arise
when I try to attach the button to a variable with BIND_VAR

```
int radioGroup;

radioGroup = dfrm_new_tbox( dial, 0, 0, "group"); /* create a radio group */

/* add the radio buttons to the group */
radioButtn1 = dfrm_new_button( dial, TYPE_XRBUT, "radio 1" );
printf("radio button 1= %d\n", radioButtn1);
// radButSelected = 3;

// dfrm_setstate( dial, radioButtn1, SELECTED, TRUE);
dfrm_attach( dial, radioButtn1, BIND_VAR, &radButSelected, 0); /* attach the button to a
variable */
dfrm_add( dial, radioGroup, radioButtn1, 10, 10, DIR_VERT);

radioButtn2 = dfrm_new_button( dial, TYPE_XRBUT, "radio 2" );
printf("radio button 2= %d\n", radioButtn2);
// radButSelected = 4;
dfrm_attach( dial, radioButtn2, BIND_VAR, &radButSelected, 0); /* attach the button to a
variable */
dfrm_add( dial, radioGroup, radioButtn2, 10, 10, DIR_VERT);
```

dfrm_attach documentation refers me to the Windom docs for objc_attach

http://windom.free.fr/doc/c_070f01.html

I have experimented with lots of variations but I either get all the radio
buttons selected (which is useless) or none selected but the bind_var
(radButSelected) only returns the same value.

Peter

6005. Re: Windom DFRM

> who can guide me ?

Feel free to ask your windom related questions on the windom mailing list.

http://sourceforge.net/mail/?group_id=68507

>
> dfrm_attach documentation refers me to the Windom docs for objc_attach
>
> http://windom.free.fr/doc/c_070f01.html

Windom "home" is http://windom.sourceforge.net/

windom documentation hosted on http://windom.free.fr/doc/ is outdated.
Do not use it ! (btw, it seems that http://windom.free.fr/dfrm/ is in
sync with the latest version of DFRM available on sf.net)

Latest version of windom documentation is available here :
http://windom.sourceforge.net/doc/html/index.html

HTH,

Arnaud.

oh its been a while now since i even looked at this thread and about a
year since i
went into pascal

thanks d slegg
i will have returned answer very soon , be back later
as what i remmeber the format is only available for total numbers
printed , but i will try myself using your example

/|\
charles

6007. Re: pure pascal floating point other than s

Source record: 126

```
thank you p . slegg
its been so long from when i had trouble ..to now ,
that i forget my orignal exact problem

but i think it was :
i couldn't print a formatted string expression of a decimal #

anyhow
i really do thank you ,

it doesn't help that any help that any resourse file i have to pure
pascal is in german , i contact the company selling these and they
don't seem to have an english version.
but didn't respond to my email correctily so it is a langauge
barrier.

here is a good result of what i had in mind

thanks again

charles

uses tos,dos,gem,system,crt;

var
a:real;
aa,bb:byte;

begin
aa:=4;
bb:=4;

a:=111;

writeln(a/100:aa:bb);

end.
```

6008. AHCC V4.4

Newsgroup: comp.sys.atari.programmer
Date: 2011-02-17 14:37:48 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3c05c$4d5d32de$18842070$1633@news.chello.nl>
Source record: 127
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my homepage (see sig)

Changes:
february 17 2011
v4.4

Compiler:
Fixed a bug in switch statements when a table is generated.
The problem only occurs in leaf functions (no further calls).
A argument register was not saved.
Fixed a regression where redeclarations of variables
were not anymore rejected.
Bitfields now also work with option -i (type int is 32 bits).
The fields are packed into a 32 bit word.
Code rearrangement such that (a##b##c) is now correctly
retokenized.

Assembler:
Fixed a regression where C style #if* directives were
handled incorrect resulting in strange error messages.
Fixed a regression where local labels within a module
were incorrectly matched to equally named local labels
in previous modules.
Implemented scope for dot prefixed labels.
(local between non dotted labels)
Labels within modules couldnt be exported. Fixed.

Library:
Added missing function 'ceil'
Added SozobonX gemfast replacement 'gemf.lib'
The lib is a wrapper around ahcc's gemlib.
New include files unistd.h, sys/stat.h, sys/types.h
These replace functions in ext.h and hence are
included by ext.h.
Fixed a bug in sleep(). The bug prevented sleep()
from sleeping.

Linker:
Removed redundant debug messages about doubly defined
names that could result in a crash.

6009. Atari Jabber Network

Newsgroup: comp.sys.atari.programmer
Date: 2011-04-16 21:07:55 UTC
From: "ragnar76@googlemail.com" <ragnar76@googlemail.com>
Message-ID: <3d598592-0ef2-4afb-9c88-a5a3175eb433@w36g2000vbi.googlegroups.com>
Source record: 128
Cross-posted to:
comp.sys.atari.st,de.alt.folklore.computer,comp.sys.atari.programmer,comp.sys.atari.st.tech,alt.atari-jaguar.discussion

Hi Atarians,

This should not be a usual commercial. I want you to know that we
(Frederick Meißner, the hoster of the Profibuch and myself) have set
up a Jabber server for the Atari scene.

To be understood, right now, there is no native jabber client for
Atari!

For those running MiNT, MCabber (http://mcabber.com/, the successor
of well known cabber) might be pretty straightforward. Its a console
client using ncurses, like rhapsody IRC or pico editor. Another
workaround to connect to Jabber with your Atari, called BitlBee
(http://www.bitlbee.org). This is a software that acts as gateway
between IRC and Jabber (and other IM protocols). You connect via aIRC
to it, and have a room with your online buddys in.

We also have talked to Joakim to implement the XMPP protokol to aICQ.
Another port could be Psi as a desktop client (http://psi-im.org).
Understatement, it will be a big task)

If you want a Jabber Domain with "Atari" in it, join us at
http://www.atari-jabber.org

bye
Bernd

6010. New Retro Computing Web Portal

6011. AHCC V4.5

Newsgroup: comp.sys.atari.programmer
Date: 2011-06-14 12:24:20 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <b3b13$4df75349$d52e2fcd$25265@news.chello.nl>
Source record: 130
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my homepage (see sig).

Changes:

june 2011
v4.5
Compiler:
Fixed a regression since 4.4 causing a alignment error
when a bitfield was followed by a plain char declaration.

Optimization of table switch such that large gaps
between groups of close case values are dealt with
efficiently.

Correction in table switch for Coldfire code.
Index scaling by shift: long.
Promote unprototyped pushing of floats and ints.
Fix l and f postfix with float constants.

Assembler:
Digit zero is NOT a octal prefix in assembly files.

Implemented * operand.
Implemented 'dcb' statement.
'repeat' statement can now be nested.
Macros can have 'repeat' statements.
Repeat value can be any constant expression.
Repaired equ and = statements.

Library:
Added atan2 to ahccstd.lib
Moved a few local arrays in the VDI bindings to static.
Savess some stack when used in PROGDEF's.

Have fun.

LS

There is a new version available on my home page (see sig).

Changes:
june 24 2011
v4.6
Compiler:
Cast condition code to int on unary plus/minus to
comparisons. (think about it :-)
Also a fix in condition code casting for Coldfire.
Fixed a regression since V3.b4 where differences
between a function prototype and its actual declaration
were not error flagged anymore.

Assembler:
Coldfire instruction set completed. The set is complete,
but check for specific Coldfire restrictions on already existing
instructions is not performed yet. This will be done
in a future release. You can run the new Digger V8 on
object files for checking validity of your Coldfire code.

Library:
Created library ahccstfi.lib.
A standard library for Coldfire but without floating
point. Affects particularly printf and scanf.
For coldfire compatible programs not needing floating
point that one would like to run on a Falcon witout FPU.

Added functions _crystal() and vdi() and struct _VDIParBlk
for programs that submit extra bindings based on the
Pure C GEM library.

Have fun.

```
There is a new version of Digger (TT-Digger) available on
my home page (see sig).

Changes:

june 2011 v8

Coldfire support.
=================

Name abreviated to "Digger".

Fixed a bug in fmove.l #data, FPcr.
Fixed a bug with int set to size 4.

New menu entry in menu title Goto
'dc.w in text <d>'
Go to the next dc.w in the text segement.
It is about a dc.w due to disassembly failure,
not the result of a 'data' mark.

These 'dc.w's are displayed in bold red.

There are 2 binaries:
DIGGER.PRG 68000 versie: runs on every Atari or clone.
DIGGERCF.PRG 68020+ versie: runs on Falcon or higher and Firebee.

The soures of Digger are part of the AHCC distribution.

6014. Earn money easily. Only honest people!!!

Newsgroup: comp.sys.atari.programmer
Date: 2011-07-23 19:08:53 UTC
From: Pablo Vt <pblvt83@gmail.com>
Message-ID: <71eb5e55-b24b-4597-bf8b-dafbfbc49a33@e35g2000yqc.googlegroups.com>
Source record: 133

Please read the following text is super interesting and will earn you many dollars if you follow the instructions with honesty and a minimum of effort (if you're not an honest person, I ask you please do not go forward, all you will achieve is to affect people who rely on transparency and the principles). It only takes 3 minutes to read this article and you will not regret. There is no trick or anything weird. It is a very old and simple that is based on trust in others.

A few days ago I'm looking for ways to earn some extra money over, apart from that I get for surfing the Internet. This go around newsgroups, bulletin boards, classified ads, search engines. In all these places find messages like I reproduce below. Then I kept thinking: It is simply a string, this is something that does not work. What if it works. This is not something new, as is done for decades and do not know of anyone who has made money. And if it works. Thinking it is a real job. WHAT IF IT WORKS. I finally decided and here I am. If you also decide you or in doubt, read on.

Do not think that will be easy, you need to post this message everywhere you can think of publishing, news, message boards, classifieds, etc.. The greater the number of times you repeat it better for you (and me of course), so I say it's a real job. It'll take several hours, will require all your experience, will also depend on your perseverance to continue to publish and your ability to promote it.

The difference with what was done before with traditional mail this chain is not dependent on five or ten people who will get the message, but is for everyone, and on the Internet there are thousands of people will notice and some (like me) will decide.And finally, how did you think you can learn a task like this to apply in future work? I am now the last on the list that you are getting and where (if you move on) you'll be repeating the message, leaving junior. I wish you luck, because luck is also part of this will be for me.

This is the message I found:
"A few days ago, when" surfing "through these pages, likewise as you are doing now, I found an article similar to this that said you can earn thousands of dollars within weeks with an investment of U $ S 6.00 !. I immediately thought, "Oh no! Another scam? ", But like most of us, curiosity got the better, and kept reading. He continued that you send to U $ S1.00 each of the 6 names and addresses mentioned in this article. Then you . write down your name and address at the bottom of the list replacing # 6, and send or put this article in at least 200 "newsgroups" (There are thousands of these around the

world). No tricks, that was it. The great difference between this system and others is that you have a list of 6 instead of 5. This means that your average gain is about 15 times greater! After thinking over and over again, and check with friends first I decided to try it. I thought I could lose was only 6 stamps and $ S 6.00, right?. As probably many of us I was a little concerned about the legality of this. Then I consulted with the Post Office in Chile and they confirmed that was actually legal!. Then I invested my U $ S6.00 !!!... Imagine ..... at 7 days, I started getting money in the mail!. I was surprised! still thought this will end soon, and thought no more of anything else. But the money just kept coming. In my first week I made a U $ S20.00. Pera the end of the second week I had made a total of more than U.S. $ 1, 000.00! !! In the third week I had over U $ S10, 000.00 and more still coming.
This is my fourth week and I did a total of more than U $ S41, 000.00 and this is coming soon (my wife and children opened the envelopes are passed and I getting "Newsgroup"). This was serious!!
All this really worth the investment of $ 6.00 and 6 stamps. I spent more than that in sweepstakes and lotteries! "

Let me explain how this works and most importantly why it works so well, make sure you print a copy of this article NOW, to get all information as needed. The process is very simple and consists of 3 easy steps:

STEP 1: Get 6 separate pieces of paper and write each "Please include me YOUR MAILING LIST OR E-MAIL".

Now get 6 bills of U.S. $ 1.00 and enter the dollar in an envelope with the sheet so that the bill will not be seen through the envelope! Better put it locked in a dark colored paper to prevent theft of mail. You should now have 6 sealed envelopes and in them a paper with the phrase referred to, your name and address, and a $ 1.00. What you are doing is creating a "service" and that makes this is ABSOLUTELY LEGAL! You can also send the equivalent of U.S. $ 1 (1 dollar).

Please send the 6 envelopes to the following addreses:

(1)
Rene Frades
Ruta Provincial N° 23 km 3,5
San Justo
Provincia de Entre Rios - Argentina,
Codigo postal (3262)
(2)
Rodríguez Leonardo Vicente
9 de Julio nº 2015
Concepción del Uruguay
Provincia de Entre Ríos - Argentina,
Codigo postal (3260)
(3)
Amado David Exequiel

Sargento Cabral 1259
San Lorenzo
Provincia de Santa Fe-Argentina
Codigo Postal: (2200)
(4)
José Menares Morán
Avda. Portales 936
Maipú
Santiago-Chile
Código Postal: (7292004)
(5)
Katherine Chacón Pérez
Cerro La Coipa 777
Rosario
Copiapó-Chile
Código Postal: (1532640)
(6)
Pablo Vita
Calle ELORDI N° 331
(código postal: 8370) San Martín de los Andes
Provincia de Neuquén
Argentina

STEP 2: Now take the # 1 listed above, move the other names up number (# 6 becomes # 5, # 5 becomes # 4, etc.) and add YOUR NAME and address as # 6 on the list. REMEMBER, you have to DELETE THE POST # 1 (NOT THE # 6), MODIFY THE NUMBER OF WHICH ARE MADE, AND ADD YOUR NAME AND ADDRESS AS THIS POSITION # 6.

STEP 3: Change anything that we believe in this article, but try to keep as close to original as possible. Now, post your amended article to at least 200 "newsgroups" (there are over 24,000 groups).
You only need 200, but when you put more quantity, more money will come!. Here are some pointers on how to enter the "newsgroups"

------------------------------...
ALL!. All you have to do is get in different "Newsgroups" and slurred, when I have practice, it only takes about 30 seconds for each newsgroup! ** REMEMBER, MANY MORE NEWSGROUPS OBTAIN, MORE ANSWERS (AND MONEY) YOU WILL RECEIVE! BUT YOU MUST ENTER AT LEAST 200 **
NOW !!!.... You will be receiving money from around the world, in places you never know and a few days!. Eventually want to rent a POBox in the amount of envelopes that will be receiving. If you prefer using nicknames, you can create a name every time the postman delivers where it should. ** MAKE SURE ALL THE ADDRESSES ARE CORRECT Now the WHY of all this: Of 200 postings, say I receive only 5 replies (a very low example). Then I made $ 5.00 with my name at # 6 in this letter. Now, each of the 5 persons who sent me $ 1.00 also make at least 200 newsgroups, each with my name at # 5 on the list and only 5 persons respond to each of the original 5, this makes $ 25.00 plus I receive, now these 25 people put at least 200 newsgroups with my name at # 4

and only receive 5 replies each. Others would be doing additional $ 125.00. Now this 125 people put their least 200 newsgroups with my name at # 3 and only receive 5 replies each, I get an additional 625.00!. OK, here's the fun part, each of these 625 people put their cards in other 200 groups with my name at # 2 and each one receives only 5 answers, this means that I get $ 3,125.00!. These 3,125 persons sent this message to at least 200 newsgroups with my name at # 1 and if only 5 people respond to the 200 groups, I will receive $ 15,625.00!. From an original investment of $ 6.00! more stamps. FABULOUS!. And as I said before, that only 5 people respond is unlikely, the real average would be 20 or 30 people!. So let's put these numbers to calculate. If only 15 people respond, it does in the # 6 $ 15.00 at # 5 $ 225.00 at # 4 $ 3375.00 at # 3 $ 50,625.00 at # 2 $ 759,375.00 at # 1 $ 11,390,625.00 if more than eleven million dollars!

Once your name is no longer on the list, remove the last announcement of the Newsgroup and send another $ 6.00 to names on the list, putting your name at # 6 and repeat the process. And start putting them in the newsgroup again. The thing to remember is that thousands more throughout the world, connect to the Internet every day and read these articles every day as YOU and I do!. So I think nobody would have problems to invest $ 6.00 and see if this really works. Some people even think "and if nobody decides to answer?" What! What is the chance of this happening when there are thousands of honest people (like us) looking for a way to have financial independence and !!!., pay bills and are willing to try, because "There is no greater struggle not done. " There are an estimated 20,000 to 50,000 new users EVERY DAY! (Worldwide) ******* ANOTHER SYSTEM TO COMMUNICATE IS GETTING E-MAIL OF PARTICULAR PEOPLE MUST BE AT LEAST 200 DIRECTIONS S, AND THIS HAS A MINIMUM EFFECTIVENESS OF 5% TO 15%. IF ONLY LOOKING SPEAKERS IN SPANISH, GO TO A PROVIDER OF E-MAILS AND PRINT A LATIN LAST NAME AND NOW.

********** Remember doing this in CORRECT, CLEAN AND HONESTLY and operate safely. You just have to be honest. Be sure to print this article NOW, Try to keep the list of those who send them money and always watch the newsgroups and see if all are participating cleanly. Remember, HONESTY IS THE BEST METHOD.
No need to do tricks with the basic idea of making money on this! BLESSINGS FOR ALL and luck, play fair and take this wonderful opportunity to make tons of money on the internet.
** By the way, if you defraud people putting messages with your name and not send any money to the others on that list, you will receive almost ANYTHING!.
TIME IS IMPORTANT! Should not miss more than 7 days from the time you see this article!. You can also get lists of E-MAIL for extra dollars. Let all the rules of business!
Remember to mention these extra profits in their tax returns.

* IF YOU HAVE ANY QUESTIONS OR NEED HELP JUST SEND ME AN E-MAIL (ka_ch_p@hotmail.com). AND REMEMBER, HONESTY IS THE ONE!

I already send my 6 dollars and cost me nothing, now I'm getting dollars in my house. I was honest and a strong will I can make up to $ 1000 dollars per week. Good luck.Goodbye.

"IMPORTANT"

FOR THE MONEY FOLLOW THE INSTRUCTIONS STEP BY STEP THE TEXT WITHOUT ANY FAIL

6015. AHCC V4.7

Newsgroup: comp.sys.atari.programmer
Date: 2011-11-13 22:22:05 UTC

LS

There is a new version available on my homepage (see sig)

I have included the A_... header files that belong to my
experimentation with syntax. (not activated)

Changes:
november 14 2011
v4.7
Compiler:
Slight reduction of spurious error messages.

Wrong code was generated when converting a real
to unsigned long.

New header file stdbool.h
small fixes in compiler.h

Fixed a error when a input name is a filename only, no slashes.

Fixed a mistake with eliminating the false side of a
expression of the form: constant ? x : y
where the true side is a binary operation.

For Coldfire:
Small fix in the new code tables for Coldfire.
Affects long mul/div.

Cleanup of Coldfire code generator.
Intruduction of code table for assignment.
Many fixes in the code for Coldfire floating point.

In rare cases the optimizer must split a move.
If no registers are available a pusher is generated.
(Until now a message "no free reg" was displayed in stead.)
Fixed a bug in a table causing some registers to be
kept alive forever, causing the above split.

Editor:
'_' is a alphanumeric character for bold display.

Kit:
Replaced checkbox 'word' by 3 radiobuttons:
whole word
word begin
anywhere

Which makes it possible to find a string that is the
beginning of a word. (e.g. prefixes).

Library:
gemf.lib
Fix a confusion in gemf.h
removed #define gl_apid _app
The 2 names have NOT the same meaning.

ahccgem.lib, ahccgemf.lib
Fix in appl_init regarding returning of application
identifier.

Have fun.

```
LS

There is a new version available on my home page (see sig)

Changes:

november 28 2011
v4.8
Compiler:
Fix a crash that sometimes could occur when a local
initializer was absent or was wrong.
Fix a crash when a while expression is wrong or absent.
Allow {} around any local initializer.

Deny arrays of void.
Deny returning of arrays.

Fixed a regression since 4.7 leading to incorrect code
in rare situations.

Fix a error preventing floating constants of the form:
nE-n from compiling correctly.

Coldfire:
Fix incorrect code when a temporary was needed
from a memory location.

Library:
Fixed a leftover from Sozobon, where a floating point
integral part could not exceed |2^31|.

Changed v_pie --> v_pieslice

Have fun

LS

There is a new version available on my home page (see sig)

Changes:

januari 24 2012
v4.9
Compiler:
Fixed a extremely stupid bug where comparisons of the kind
'constant compared to variable' were reversed wrongly.
e.g. (0 < i)

Fixed a terrible bug where under certain circumstances
a ftst insstruction got lost.

Accept spurious ampersand to a function name to get a
reference to that function.

There are FPU instruction that are NOT unary operaters.
These are: fmod, modf, ldexp and frexp.
Put these function in ahccstd.lib.

Fixed wrong code with comma expressions within expressions.

Coldfire:
Fix in the Coldfire Floating point code table.

Do not generate addressing mode 6 (An,Xn) with floating point
instructions.

Do not generate FScc instructions.
Repaired wrong divide for pointer difference calculation.

Library:
stdio.c: function tmpfile added.
string.c: function strtoul added.
stdlib.c: function system added.
ahccstdf.lib
Added support for missing FPU instructions on Coldfire.

Source record: 141

Please, what is the structure of a .ST file emulating an Atari ST
floppy disk?
It gets 738.260 B versus 726.016 on the FD.
Thanks
Paul

6023. AHCC V4.11

Newsgroup: comp.sys.atari.programmer
Date: 2012-05-30 13:19:28 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <jq56p1$c6m$1@dont-email.me>
Source record: 142
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

```
LS

There is a new version available on my home page (see sig)

Changes:
may 30 2012
v4.11
Compiler:
Revision of registerization of local variables.
Produces slightly better code.
Also repairs Draconis Marathon.

Fixes a bug where a explicit cast of ptr to long or vv
was handled incorrectly.

A further bugfix (A very very old one, perhaps since v3b1).

Assembler:
Implemented opcodes:
align
aline
Allow single = for 'equals' in IF expressions.

Full implementation of 'equ' expressions.

addq.w #n,An
addq.b #n,An
silently changed to addq.l #n,An.

2 new pseudo opcodes for use with Coldfire compatible
programs:
xsave reglist
xrest reglist
The instructions generate the movem sequences required
for Coldfire campatibility. You, as a programmer, do
not have to count the registers for the lea instructions.
The compiler will do that for you and also generate
the lea's.

Library:
Provided 68000/Coldfire usable TOS bindings in case
a project did not include the AHCC specific tos.h
(The one that uses __syscall__).
The library is called "ahcctos.lib".
```

"
which is apparently a known GNU / GCC bug according to
<http://gcc.gnu.org/bugzilla/show_bug.cgi?id=23442>
I'm using gcc 4.2.1 under Mac OS X 10.6.8, on a quad-core i5.

Does somebody already encounter this bug, and bypassed it ?

Thanks to help,

Best regards,

Saw your name on here and I remember you when I was still using my ST
1999-2002. Good to see you still here.

LS

There is a new version available on my home page (see sig).

Changes:
september 22 2012
v4.12
General:
Changed 'xref' to 'pdb' in all source files
(pdb = Project Data Base, xref.... is only part of it).

Compiler:
Fixed non Coldfire code for 'move' in some cases.
Also fixed a bug where mov3q could have been used, but
was not.

Shell:
Small fix in handling time/date stamps by make.
Pass uppercase masks to fileselecter when run on single TOS.

Assembler:
Fix dc.l name +/- nnnn
where nnnn got lost resulting wrongfully in dc.l name.

Library:
ahccstd*: Added unlink, strcmpi.

LS
There is a new vwersion available on
http://members.chello.nl/h.robbers/

Only 1 change:

september 28 2012
v4.13
Compiler(Coldfire target)
Fixed a regression in 4.12 concerning use of 'mov3q' instruction.

LS

There is a new version availble on:
http://members.chello.nl/h.robbers/

october 3 2012
v4.14
General:
Removed leftover traces of a debug session some time ago.

Compiler:
Fixed a bug where a static string was not properly
used (changed without copying)
The bug resulted in incorrect compiling of ahccstdi.lib.

Assembler:
Fixed a regression where incbin statement crashed.

Have fun.

Hello to all
For research I would like to program an Atari ST.
To begin programming an Atari ST what do you recommend?
Are there examples of programming?
Thank you
